(54) Title: RECOMBINANT HERPESVIRUS OF TURKEYS AND USES THEREOF

(57) Abstract

This invention provides a recombinant herpesvirus of turkeys comprising a foreign DNA sequence encoding a cytokine inserted into an insertion region which comprises a XhoI site within an EcoRI #9 fragment of a herpesvirus of turkeys viral genome, and the foreign DNA sequence encoding a cytokine which is capable of being expressed in a host cell infected with the herpesvirus of turkeys. This invention provides a recombinant herpesvirus of turkeys-Marek's disease virus chimera comprising a herpesvirus of turkeys unique long viral genome region and a Marek's disease virus unique short region. Lastly, this invention provides homology vectors for producing a recombinant herpesvirus of turkeys, host cells, and vaccines and methods for immunization.

RECOMBINANT HERPESVIRUS OF TURKEYS AND USES THEREOF

5 This application is a continuation of U.S. Serial No. 08/362,240, filed December 22, 1994, which is a continuation-in-part of 08/288,065, filed August 9, 1994, the contents of which are hereby incorporated by reference into.

10 Throughout this application various publications are referenced by Arabic numerals in parenthesis. Full citations for these publications may be found at the end of the specification immediately preceding the claims. The disclosures of these publications are in  
15 their entirety hereby incorporated by reference into this application to more fully describe the state of the art to which this invention pertains.

20 BACKGROUND OF THE INVENTION

The ability to isolate DNA and clone such isolated DNA into bacterial plasmids has greatly expanded the  
25 approaches available to make viral vaccines. The methods used to make the present invention involve modifying cloned DNA sequences from various viral pathogens of animals, by insertions, deletions, single or multiple base changes, and subsequent insertions of  
30 these modified sequences into the genome of the virus. One utility of the addition of a foreign sequence is achieved when the foreign sequence encodes a foreign protein that is expressed during viral infection of the animal. The resulting live virus may then be used in  
35 a vaccine to elicit an immune response in a host animal

and provide protection to the animal against disease. A virus with these characteristics is referred to as a viral vector, because it becomes a living vector that will carry and express the foreign protein in the host animal. In effect it becomes an elaborate delivery system for the foreign protein(s).

More specifically, the present invention relates to the use of herpesvirus of turkeys (HVT) as a viral vector for vaccination of birds against disease. The group of herpesviruses comprise various pathogenic agents that infect and cause disease in a number of target species: swine, cattle, chickens, horses, dogs, cats, etc. Each herpesvirus is specific for its host species, but they are all related in the structure of their genomes, their mode of replication, and to some extent in the pathology they cause in the host animal and in the mechanism of the host immune response to the virus infection.

The application of recombinant DNA techniques to animal viruses has a relatively recent history. The first viruses to be engineered have been those with the smallest genomes. In the case of the papovaviruses, because these viruses are so small and cannot accommodate much extra DNA, their use in genetic engineering has been as defective replicons. Foreign gene expression from these viruses requires a wild-type helper virus and is limited to cell culture systems. For adenoviruses, there is a small amount of nonessential DNA that can be replaced by foreign sequences. The only foreign DNA that seems to have

been expressed in adenoviruses are the T-antigen genes from papovaviruses (Mansour, et al., *Proc. Natl. Acad. Sci. US*, 1985; Thummel, et al., *Cell*, 1983; Scolnick, et al., *Cell*, 1981; Thummel, et al., *Cell*, 1981), and the herpes simplex virus (HSV) thymidine kinase gene (Haj-Ahmed and Graham, *J. of Virology*, 1986). These publications do not identify the nonessential regions in HVT wherein foreign DNA may be inserted, nor do they teach how to achieve the expression of foreign genes in HVT, e.g., which promoter sequence and termination sequence to use.

Another group of viruses that have been engineered are the poxviruses. One member of this group, vaccinia, has been the subject of much research on foreign gene expression. Poxviruses are large DNA-containing viruses that replicate in the cytoplasm of the infected cell. They have a structure that is unique in that they do not contain any capsid that is based upon icosahedral symmetry or helical symmetry. The poxviruses are most likely to have evolved from bacterial-like microorganisms through the loss of function and degeneration. In part due to this uniqueness, the advances made in the genetic engineering of poxviruses cannot be directly extrapolated to other viral systems, including herpesviruses and HVT. Vaccinia recombinant virus constructs have been made in a number of laboratories that express the following inserted foreign genes: HSV thymidine kinase gene (Mackett, et al., *Proc. Natl. Acad. Sci. USA*, 1982; Panicali and Paoletti, *Proc. Natl. Acad. Sci. USA*, 1982, hepatitis B surface antigen (Paoletti, et al., *Proc. Natl. Acad. Sci. USA*, 1984;

Smith et al., *Nature*, 1983), HSV glycoprotein D gene, influenzae hemagglutinin gene (Panicali, et al., *Proc. Natl. Acad. Sci. USA*, 1983; Smith, et al., *Proc. Natl. Acad. Sci. USA*, 1983), malaria antigen gene (Smith, et al., *Science*, 1984, and vesicular stomatitis glycoprotein G gene (Mackett, et al., *Science*, 1986). The general overall features of vaccinia recombinant DNA work are similar to the techniques used for all the viruses, especially as they relate to the techniques in reference (Maniatis, et al., *Molecular Cloning*, 1982). However in detail, the vaccinia techniques are not applicable to herpesviruses and HVT. The utility of vaccinia as a vaccine vector is in question because of its close relationship to human smallpox and its known pathogenicity to humans. Thus, the use of the host-specific herpesvirus HVT is a better solution to vaccination of poultry.

20

Among the primate herpesviruses, only HSV of humans and, to a limited extent, herpes saimiri of monkeys have been engineered to contain foreign DNA sequences. The first use of recombinant DNA to manipulate HSV involved cloning a piece of DNA from the L-S junction region into the unique long region of HSV DNA, specifically into the thymidine kinase gene (Mocarski, et al., *Cell*, 1980). This insert was not a foreign piece of DNA, rather it was a naturally occurring piece of herpesvirus DNA that was duplicated at another place in the genome. This piece of DNA was not engineered to specifically express a protein, and thus this work does not involve expression of protein in herpesviruses. The next manipulation of HSV involved the creation of deletions in the virus genome by a combination of

35

recombinant DNA techniques and thymidine kinase selection. Using this approach, the HSV alpha-22 gene has been deleted (Post, et al., *Cell*, 1981), and a  
5 15,000 basepair sequence of DNA has been deleted from the internal repeat of HSV (Poffenberger, et al., *Proc. Natl. Acad. Sci. USA*, 1981).

10 The following cases involve insertion of genes that encode protein into herpesviruses: the insertion of HSV glycoprotein C into a naturally occurring deletion mutant of this gene in HSV (Gibson and Spear, *J. of Virology*, 1983); the insertion of glycoprotein D of HSV  
15 type 2 into HSV type 1 (Lee, et al., *Proc. Natl. Acad. Sci. USA*, 1982), with no manipulation of promoter sequences since the gene is not 'foreign'; the insertion of hepatitis B surface antigen into HSV under the control of the HSV ICP4 promoter (Shih, et al.,  
20 *Proc. Natl. Acad. Sci. USA*, 1984); and the insertion of bovine growth hormone into herpes saimiri virus with an SV40 promoter (the promoter did not work in this system and an endogenous upstream promoter served to transcribe the gene) (Desrosiers, et al., 1984). Two  
25 additional foreign genes (chicken ovalbumin gene and Epstein-Barr virus nuclear antigen) have been inserted into HSV (Arsenakis and Roizman, 1984), and glycoprotein X of pseudorabies virus has been inserted into HSV (Post, et al., 1985).

30 These cases of deletion or insertion of genes into herpesviruses demonstrate that it is possible to genetically engineer herpesvirus genomes by recombinant  
35 DNA techniques. The methods that have been used to

insert genes involve homologous recombination between the viral DNA cloned in plasmids and purified viral DNA transfected into the same animal cell. However, the extent to which one can generalize the location of the deletion and the sites for insertion of foreign genes is not known from these previous studies.

One object of the present invention is a vaccine for Marek's disease. Marek's disease virus (MDV) is the causative agent of Marek's disease which encompasses fowl paralysis, a common lymphoproliferative disease of chickens. The disease occurs most commonly in young chickens between 2 and 5 months of age. The prominent clinical signs are progressive paralysis of one or more of the extremities, incoordination due to paralysis of legs, drooping of the limb due to wing involvement, and a lowered head position due to involvement of the neck muscles. In acute cases, severe depression may result. In the case of highly oncogenic strains, there is characteristic bursal and thymic atrophy. In addition, there are lymphoid tumors affecting the gonads, lungs, liver, spleen, kidney and thymus (Mohanty and Dutta, 1981).

Most chickens are vaccinated against MDV at one day of age to protect the bird against MDV for life. Prior to the present invention, the principal vaccination method for MDV involved using naturally occurring strains of turkey herpesvirus (HVT). It would be advantageous to incorporate other antigens into this vaccination at one day of age, but efforts to combine conventional vaccines have not proven satisfactory to date due to

competition and immunosuppression between pathogens. The multivalent HVT-based vaccines engineered in this invention represent a novel way to simultaneously  
5 vaccinate against a number of different pathogens. For the first time, a recombinant HVT with a foreign gene inserted into a non-essential region of the HVT genome is disclosed.

10 The types of genetic engineering that have been performed on these herpesviruses consist of cloning parts of the virus DNA into plasmids in bacteria, reconstructing the virus DNA while in the cloned  
15 state so that the DNA contains deletions of certain sequences, and furthermore adding foreign DNA sequences either in place of the deletions or at sites removed from the deletions.

20 A foreign gene of interest targeted for insertion into the genome of HVT may be obtained from any pathogenic organism of interest. Typically, the gene of interest will be derived from pathogens that in poultry cause  
25 diseases that have an economic impact on the poultry industry. The genes may be derived from organisms for which there are existing vaccines, and because of the novel advantages of the vectoring technology the HVT derived vaccines will be superior. Also, the gene of  
30 interest may be derived from pathogens for which there is currently no vaccine but where there is a requirement for control of the disease. Typically, the gene of interest encodes immunogenic polypeptides of the pathogen, and may represent surface proteins, secreted proteins and structural proteins.  
35

A relevant avian pathogen that is a target for HVT vectoring is Infectious Laryngotracheitis virus (ILTV). ILTV is a member of the herpesviridae family, and this pathogen causes an acute disease of chickens which is characterized by respiratory depression, gasping and expectoration of bloody exudate. Viral replication is limited to cells of the respiratory tract, where in the trachea the infection gives rise to tissue erosion and hemorrhage. In chickens, no drug has been effective in reducing the degree of lesion formation or in decreasing clinical signs. Vaccination of birds with various modified forms of the ILT virus derived by cell passage and/or tedious regimes of administration have conferred acceptable protection in susceptible chickens.\* Because of the degree of attenuation of current ILT vaccines care must be taken to assure that the correct level of virus is maintained; enough to provide protection, but not enough to cause disease in the flock.

An additional target for the HVT vectoring approach is Newcastle disease, an infectious, highly contagious and debilitating disease that is caused by the Newcastle disease virus (NDV). NDV is a single-stranded RNA virus of the paramyxovirus family. The various pathotypes of NDV (velogenic, mesogenic, lentogenic) differ with regard to the severity of the disease, the specificity and symptoms, but most types seem to infect the respiratory system and the nervous system. NDV primarily infects chickens, turkeys and other avian species. Historically vaccination has been used to prevent disease, but because of maternal antibody interferences, life-span of the bird and route of

administration, the producer needs to adapt immunization protocols to fit specific needs.

5 The therapeutic agent that is delivered by a viral vector of the present invention must be a biological molecule that is a by-product of swinepox virus replication. This limits the therapeutic agent in the first analysis to either DNA, RNA, or protein. There are examples of therapeutic agents from each of these  
10 classes of compounds in the form of anti-sense DNA, anti-sense RNA (S. Joshi, et al., *J. of Virology*, 1991), ribozymes (M. Wachsman, et al., *J. of General Virology*, 1989), suppressor tRNAs (R.A. Bhat, et al., *Nucleic Acids Research*, 1989), interferon-inducing  
15 double stranded RNA and numerous examples of protein therapeutics, from hormones, e.g., insulin, to lymphokines, e.g., interferons and interleukins, to natural opiates. The discovery of these therapeutic agents and the elucidation of their structure and  
20 function does not make obvious the ability to use them in a viral vector delivery system.

#### SUMMARY OF THE INVENTION

25 This invention provides a recombinant herpesvirus of turkeys comprising a foreign DNA sequence encoding a cytokine inserted into an insertion region which comprises a XhoI site within a EcoRI #9 fragment of a  
30 herpesvirus of turkeys viral genome, and the foreign DNA sequence encoding a cytokine which is capable of being expressed in a host cell infected with the herpesvirus of turkeys.

35 Lastly, this invention provides homology vectors for producing a recombinant herpesvirus of turkeys, host cells, and vaccines and methods for immunization.

**BRIEF DESCRIPTION OF THE FIGURES****Figures 1A-1C: Details of HVT Construction and Map Data.**

Figure 1A shows *Bam*HI restriction fragment map of the HVT genome. Fragments are numbered in order of decreasing size; letters refer to small fragments whose comparative size has not been determined.

Figure 1B shows *Bam*HI #16 fragment of the HVT genome showing location of  $\beta$ -galactosidase gene insertion in S-HVT-001.

Figure 1C shows *Bam*HI #19 fragment of the HVT genome showing location of  $\beta$ -galactosidase gene insertion.

Legend: B = *Bam*HI; X = *Xho*I; H = *Hind*III; P = *Pst*I; S = *Sal*I; N = *Nde*I; R = *Eco*RI.

**Figures 2A-2D: Insertion in Plasmid 191-47.**

Figure 2A contains a diagram showing the orientation of DNA fragments assembled in plasmid 191-47. Figures 2A to 2D show the sequences located at each of the junctions between the DNA fragments in plasmid 191-47. (SEQ ID NOS: 20, 21, 22, 23, 24, 25, 26, and 27).

**Figures 3A-3B: Details of S-HVT-003 Construction.**

Figure 3A shows restriction map of HVT DNA in the region of the *Bam*HI #16 fragment. This fragment is contained within large *Hind*III fragment. Figure

3A also shows the XhoI site which was first changed to an EcoRI (R) site by use of a "linker" and standard cloning procedures. Figure 3A also shows details of the construction of the beta-gal gene and IBVD gene inserted into the BamHI #16 fragment for use in homologous recombination. Both genes were under the control of the PRV gX gene promoter (gX).

Figure 3B show the S-HVT-003 genome, including the location of the two inserted foreign genes,  $\beta$ -gal and IBDV.

In Figure 3 : H = HindIII; B = BamHI; X = XhoI; R = EcoRI; Xb = XbaI; Hp = HpaI; S = SmaI; UL = unique long region; US = unique short region; IR = internal repeat region; TR = terminal repeat region.

**Figure 4:**

Western blot indicating the differential expression of the IBVD 32kD antigen in cellular lysates of S-HVT-003 infected cells (32kD present) and S-HVT-001 infected cells (32kD negative). IBVD specific polypeptides were identified by probing the blot with hyper-immune rat antiserum directed against denatured IBVD virions. This serum reacts primarily with the immunodominant 32kD antigen (IBVD VP3). The lanes on the blot contain: 1) protein molecular weight standards, 2) uninfected CEF cells, 3) S-HVT-001 infected CEF's, 4) 5) & 6) S-HVT-003 and 7) IBVD virion polypeptides.

**Figure 5:**

Western blot indicating the differential expression of the 42kD (VP2) antigen in cellular

lysates of S-HVT-003 infected cells (42kD present) and S-HVT-001 infected cells (42kD negative). IBDV specific polypeptides were identified using a VP2 specific rabbit anti-peptide antiserum. The lanes contain: 1) protein molecular weight standards, 2) wild-type HVT infected CEF's, 3) S-HVT-001 infected CEF's, 4) S-HVT-003 infected CEF's, 5) S-HVT-003 infected CEF's, and 6) IBDV virion polypeptides.

**Figures 6A-6C: Details of S-HVT-004 Construction.**

Figure 6A is a restriction map of HVT DNA in the region of the *Bam*HI #16 fragment. This fragment is contained within a large *Hind*III fragment. Shown also is the *Xho*I site (X) where applicants have made their insertion. Before the insertion, the *Xho*I was first changed to *Eco*RI (R) site by use of a "linker" and standard cloning procedures.

Figure 6B provides details of the construction of the  $\beta$ -gal gene and MDV gA gene inserted into the *Bam*HI #16 fragment for use in homologous recombination. Beta-gal was under the control of the PRV gX gene promoter (gX), while the MDV gA gene was under the control of its own promoter.

Figure 6C is of S-HVT-004 genome showing the location of the two inserted foreign genes,  $\beta$ -gal and MDV gA.

In Figure 6, H = *Hind*III; B = *Bam*HI; X = *Xho*I; R = *Eco*RI; Xb = *Xba*I; UL = unique long region; US = unique short region; IR = internal repeat region; TR = terminal repeat region.

**Figures 7A-7B:**

Detailed description of the  $\beta$ -galactosidase (*lacZ*) marker gene insertion in homology vector 467-22.A12. Figure 7A shows a diagram indicating the orientation of DNA fragments assembled in the marker gene. The origin of each fragment is described in the Materials and Methods section. Figures 7A and 7B show the DNA sequences located at the junctions between DNA fragments and at the ends of the marker gene (SEQ ID NOs: 28, 29, 30, 31, 32, and 33). Figures 7A and 7B further show the restriction sites used to generate each DNA fragment at the appropriate junction and the location of the *lacZ* gene coding region. Numbers in parenthesis () refer to amino acids, and restriction sites in brackets [] indicate the remnants of sites which were destroyed during construction. The following abbreviations are used, pseudorabies virus (PRV), lactose operon Z gene (*lacZ*), *Escherichia coli* (E.Coli), polyadenylation signal (pA), and glycoprotein X (gpX).

**Figure 8:**

*Bam*HI, *Not*I restriction map of the HVT genome. The unique long (UL) and unique short (US) regions are shown. The long and short region repeats are indicated by boxes. The *Bam*HI fragments are numbered in decreasing order of size. The location of probes P1-P4 are indicated. The origin of each probe is as follows: P1 - *Bam*HI #6, P2 - *Bam*HI #2, P3 - *Bam*HI #13, and P4 - 4.0 kb *Bgl*III to *Stu*I sub-fragment of HVT genomic *Xba*I fragment #5 (8.0 kb).

**Figure 9:** Shows the Procedure for construction of plasmid pSY229.

5 Detailed description of the MDV gene cassette  
insert in Homology Vectors 456-18.18 and 456-  
17.22. Figure 10A and 10B show a diagram  
indicating the orientation of DNA fragments  
assembled in the cassette and the location of the  
10 MDV gA and gB genes. The origin of each fragment  
is described in the Materials and Methods section.  
The sequences located at the junctions between  
each fragment and at the ends of the marker gene  
are shown in Figures 10A and 10B, including  
15 junction A (SEQ ID NO: 34), junction B (SEQ ID NO:  
35), and junction C (SEQ ID NO: 36). The  
restriction sites used to generate each fragment  
are indicated at the appropriate junction.  
Numbers in parenthesis () refer to amino acids,  
20 and restriction sites in brackets [] indicate the  
remnants of sites which were destroyed during  
construction.

**Figures 11A-11B:**

25 Detailed description of the *HindIII* fragment  
insert in Homology Vector 556-41.5. The diagram  
of Figures 11A and 11B show the orientation of DNA  
fragments assembled in the cassette. The origin  
of each fragment is described in the Materials and  
30 Methods section. Figures 11A and 11B further show  
the DNA sequences located at the junctions between  
each DNA fragment of the plasmid and at the ends  
of the marker gene, including junction A (SEQ ID  
NO: 37), junction B (SEQ ID NO: 38), and junction  
35 C (SEQ ID NO: 39). The restriction sites used to  
generate each fragment are indicated at the  
appropriate junction. The location of the MDV gD

and a portion of the gI gene is also given. Numbers in parenthesis () refer to amino acids, and restriction sites in brackets [] indicate the remnants of sites which were destroyed during construction.

#### Figures 12A-12C:

Detailed description of the SalI fragment insert in Homology Vector 255-18.B16. Figure 12A shows a diagram indicating the orientation of DNA fragments assembled in the cassette. The origin of each fragment is described in the Materials and Methods section. Figures 12A to 12C further show the DNA sequences located at the junctions between each fragment and at the ends of the marker gene are shown, including junction A (SEQ ID NO: 40), junction B (SEQ ID NO: 41), junction C (SEQ ID NO: 42), junction D (SEQ ID NO: 43), junction E (SEQ ID NO: 44), junction F (SEQ ID NO: 45), junction G (SEQ ID NO: 46), and junction H (SEQ ID NO: 47). The restriction sites used to generate each fragment are indicated at the appropriate junction. The location of the NDV F and lacZ-NDV HN hybrid gene are shown. Numbers in parenthesis () refer to amino acids, and restriction sites in brackets [] indicate the remnants of sites which were destroyed during construction.

#### Figures 13A-13B:

Show how the unique XhoI site of the BamHI #10 fragment of the HVT genome was converted into a PacI site and a NotI site by insertion of the synthetic DNA sequence at the XhoI site (Nucleotides #1333-1338; SEQ ID NO. 48). Figure 13A shows the Xho site converted into a PacI site to generate Plasmid 654-45.1 (SEQ ID NO. 55) and Figure 13B shows the XhoI site converted into a

NotI site to generate Plamid 686-63.A1 (SEQ ID NO. 56).

**Figure 14:**

5           Restriction map and open reading frames of the  
sequence surrounding the insertion site within the  
unique long of HVT (SEQ ID NO. 48). This map shows  
the XhoI restriction site (SEQ ID NO. 48; Nucl.  
1333-1338) used for insertion of foreign genes.  
10          Also shown are four open reading frames within  
this sequence. ORF A is interrupted by insertion  
of DNA into the XhoI site. The ORF A amino acid  
sequence (SEQ ID NO. 50; Nucl. 1402 to 602; 267  
15          amino acids) shows no significant sequence  
identity to any known amino acid sequence in the  
protein databases. UL 54 (SEQ ID NO. 49; Nucl. 146  
to 481; 112 amino acids) and UL55 (SEQ ID NO. 51;  
20          Nucl. 1599 to 2135; 179 amino acids) show  
significant sequence identity to the herpes  
simplex virus type I UL54 and UL55 proteins,  
respectively. ORF B (SEQ ID NO. 52; Nucl. 2634 to  
2308; 109 amino acids) shows no significant  
25          sequence identity to any known amino acid sequence  
in the protein databases. Searches were performed  
on NCBI databases using Blast software.

**Figure 15:**

30          Restriction map of cosmids 407-32.1C1, 672-01.A40,  
672-07.C40, and 654-45.1. The overlap of HVT  
genomic DNA fragments EcoRI #9 and BamHI #10 is  
illustrated. A unique XhoI site within the EcoRI  
#9 and BamHI #10 fragments has been converted to  
a unique PacI site in Plasmid 654-45.1 or a unique  
NotI site in Plasmid 686-63.A1.

35

DETAILED DESCRIPTION OF THE INVENTION

5 This invention provides a recombinant herpesvirus of turkeys (HVT) comprising a foreign DNA sequence inserted into a non-essential site in the HVT genome. The foreign DNA sequence is capable of being expressed in a host cell infected with the recombinant HVT and its expression is under the control of a promoter located upstream of the foreign DNA sequence.

10 As defined herein "a non-essential site in the HVT genome" means a region in the HVT viral genome which is not necessary for the viral infection or replication.

15 As defined herein, "viral genome" or "genomic DNA" means the entire DNA which the naturally occurring herpesvirus of turkeys contains. As defined herein, "foreign DNA sequence" or "gene" means any DNA or gene that is exogenous to the genomic DNA.

20 As defined herein, an "open reading frame" is a segment of DNA which contains codons that can be transcribed into RNA which can be translated into an amino acid sequence and which does not contain a termination  
25 codon.

The invention further provides several appropriate insertion sites in the HVT genome useful for constructing the recombinant herpesvirus of the present  
30 invention. Insertion sites include the *EcoRI* #9 fragment and the *BamHI* #10 fragment of the HVT genome, a preferred insertion site within both of those fragments being a *XhoI* restriction endonuclease.

35 Another such site is the *BamHI* #16 fragment of the HVT genome. A preferred insertion site within the *BamHI* #16 fragment lies within an open reading frame encoding

UL43 protein and a preferred insertion site within that open reading frame in a *XhoI* restriction endonuclease site.

5 Yet another insertion site is the HVT US2 gene, with a preferred insertion site within it being a *StuI* endonuclease site.

10 This invention provides a recombinant herpesvirus of turkeys comprising a herpesvirus of turkeys viral genome which contains a foreign DNA sequence inserted within the *EcoRI* #9 fragment of the herpesvirus of turkeys viral genome, and the foreign DNA sequence is capable of being expressed in a host cell infected with  
15 the herpesvirus of turkeys.

In one embodiment, the foreign DNA sequence is inserted within an Open Reading Frame A (ORFA) of the *EcoRI* #9 fragment. Insertion of foreign DNA sequences into the  
20 *XhoI* site of *EcoRI* #9 interrupts ORFA indicated that the entire ORFA region is non-essential for replication of the recombinant.

For purposes of this invention, "a recombinant  
25 herpesvirus of turkeys" is a live herpesvirus of turkeys which has been generated by the recombinant methods well known to those of skill in the art, e.g., the methods set forth in DNA TRANSFECTION FOR GENERATING RECOMBINANT HERPESVIRUS in Materials and  
30 Methods, and the virus has not had genetic material essential for the replication of the herpesvirus of turkeys deleted. The purified herpesvirus of turkeys results in stable insertion of foreign DNA sequences or a gene in the *EcoRI* #9 fragment or *BamHI* #10 fragment.

35

The invention further provides recombinant herpesvirus of turkeys where the foreign DNA sequence encodes a

polypeptide which is antigenic in an animal into which the recombinant herpesvirus is introduced.

5 In one embodiment the polypeptide is a detectable marker. For purposes of this invention, a "polypeptide which is a detectable marker" includes the bimer, trimer and tetramer form of the polypeptide. *E. coli* B-galactosidase is a tetramer composed of four polypeptides or monomer subunits. In one embodiment  
10 the polypeptide is *E. coli* beta-galactosidase. Preferably this recombinant herpesvirus of turkeys is designated S-HVT-001, S-HVT-014, or S-HVT-012.

15 S-HVT-012 has been deposited on October 15, 1992 pursuant to the Budapest Treaty on the International Deposit of Microorganism for the Purposes of Patent Procedure with the Patent Culture Depository of the American Type Culture Collection, 12301 Parklawn Drive, Rockville, Maryland 20852 U.S.A. under ATCC Accession  
20 No. VR. 2382.

25 S-HVT-014 has been deposited on December 7, 1993 pursuant to the Budapest Treaty on the International Deposit of Microorganism for the Purposes of Patent Procedure with the Patent Culture Depository of the American Type Culture Collection, 12301 Parklawn Drive, Rockville, Maryland 20852 U.S.A. under ATCC Accession  
No. VR. 2440.

30 In another embodiment the foreign DNA sequence encodes a cytokine. In another embodiment the cytokine is chicken myelomonocytic growth factor (cMGF) or chicken interferon (cIFN). In a preferred embodiment the recombinant herpesvirus of turkeys is designated S-HVT-  
35 144.

The invention further provides a recombinant

herpesvirus of turkeys whose viral genome contains foreign DNA encoding an antigenic polypeptide which is from Marek's disease virus (MDV), Newcastle disease virus (NDV), infectious laryngotracheitis virus (ILTV),  
5 infectious bronchitis virus (IBV) or infectious bursal disease virus (IBDV).

This invention provides a recombinant herpesvirus of turkeys with a foreign DNA sequence insertion in the  
10 EcoR1 #9 fragment which further comprises a foreign DNA sequence encoding the antigenic polypeptide selected from the group consisting of: Marek's disease virus, Newcastle disease virus, infectious laryngotracheitis virus, infectious bronchitis virus and infectious  
15 bursal disease virus.

In one embodiment the foreign DNA sequence encoding the antigenic polypeptide is from Marek's disease virus and encodes Marek's disease virus glycoprotein gA, Marek's  
20 disease virus glycoprotein gB or Marek's disease virus glycoprotein gD. In another embodiment the foreign DNA sequences encoding the Marek's disease virus glycoprotein gA, glycoprotein gB or glycoprotein gD are inserted into the unique StuI site of the US2 gene  
25 coding region of the herpesvirus of turkeys.

The invention further provides recombinant herpesvirus of turkeys whose genomic DNA contains foreign DNA encoding antigenic polypeptide from Marek's disease  
30 virus. Preferably, the antigenic polypeptide is Marek's disease virus glycoprotein gB, gA or gD.

In one embodiment a recombinant HVT containing a foreign DNA sequence encodes IBV VP2, MDV gA, and MDV  
35 gB. Preferably, such recombinant virus is designated S-HVT-137 and S-HVT-143.

The invention further provides recombinant herpesvirus of turkeys whose genomic DNA contains foreign DNA encoding Marek's disease virus glycoprotein gA and further comprising foreign DNA encoding a polypeptide which is a detectable marker. Preferably, this recombinant herpesvirus of turkeys is designated S-HVT-004.

The invention further provides recombinant herpesvirus of turkeys whose genomic DNA contains foreign DNA encoding Marek's disease virus glycoprotein gB. Preferably, this recombinant herpesvirus of turkeys is designated S-HVT-045.

An embodiment of a recombinant HVT containing a foreign DNA sequence encoding MDV gB is also provided and this recombinant HVT is designated S-HVT-045. S-HVT-045 has been deposited on October 15, 1992 pursuant to the Budapest Treaty on the International Deposit of Microorganism for the Purposes of Patent Procedure with the Patent Culture Depository of the American Type Culture Collection, 12301 Parklawn Drive, Rockville, Maryland 20852 U.S.A. under ATCC Accession No. VR. 2383.

The present invention also provides recombinant HVTs engineered to contain more than one foreign DNA sequence encoding an MDV antigen. For example, a foreign DNA sequence encoding MDV gA and gB can both be vectored into the HVT genome. Furthermore, a recombinant HVT can be constructed to include a foreign DNA sequence encoding MDV gA, gB, and gD.

Recombinant HVT designated S-HVT-046 and S-HVT-047 provide embodiments of a recombinant HVT containing foreign DNA sequence encoding MDV gA and gB; recombinant HVT designated S-HVT-048 and S-HVT-062

provide embodiments of a recombinant HVT containing foreign DNA sequence encoding MDV gA, gB and gD.

5 S-HVT-062 has been deposited on February 23, 1993 pursuant to the Budapest Treaty on the International Deposit of Microorganisms for the Purposes of Patent Procedure with the Patent Culture Depository of the American Type Culture Collection, 12301 Parklawn Drive, Rockville, Maryland 20852 U.S.A. under ATCC Accession  
10 No. VR. 2401.

The present invention provides a recombinant HVT containing a foreign DNA sequence encoding an antigenic polypeptide from Newcastle disease virus (NDV). In  
15 such case, it is preferred that the antigenic polypeptide is Newcastle disease virus fusion (F) protein or Newcastle disease virus hemagglutinin-neuraminidase (HN), or a recombinant protein comprising E. coli B-galactosidase fused to Newcastle disease  
20 virus hemagglutinin-neuraminidase (HN). One example of such a virus is designated S-HVT-007.

The present invention also provides recombinant HVTs engineered to contain one or more foreign DNA sequence  
25 encoding an antigenic polypeptide from MDV as well as one or more foreign DNA sequences encoding an antigenic polypeptide from NDV. Preferably, the MDV antigenic polypeptide is MDV gB, gD, or gA and the NDV F or HN.

30 In one embodiment of the invention, the recombinant HVT contains foreign DNA sequence encoding MDV gB, MDV gA and NDV F. Preferably, this HVT is designated S-HVT-048.

35 In one embodiment of the invention, the recombinant HVT contains foreign DNA sequence encoding MDV gB, MDV gA and NDV HN. Preferably, this HVT is designated S-HVT-

049.

For example, a foreign DNA sequence encoding MDV gA and gB can both be vectored into the HVT genome. Furthermore, a recombinant HVT can be constructed to include a foreign DNA sequence encoding MDV gA, gB, and gD.

Further, in another embodiment the foreign DNA sequence encoding the antigenic polypeptide is from Newcastle disease virus and encodes Newcastle disease virus fusion protein or Newcastle disease virus hemagglutinin-neuraminidase. In another embodiment the foreign DNA sequences encoding the Newcastle disease virus fusion protein or Newcastle disease virus hemagglutinin-neuraminidase are inserted into a XhoI site in EcoRI #9 of the unique long region of the herpesvirus of turkeys. In a preferred embodiment the recombinant herpesvirus of turkeys is designated S-HVT-136.

The invention further provides recombinant herpesvirus of turkeys whose genomic DNA contains foreign DNA encoding antigenic polypeptide from Marek's disease virus and further comprising foreign DNA encoding antigenic polypeptide from Newcastle disease virus.

The present invention further provides a recombinant HVT which contains a foreign DNA sequence encoding an antigenic polypeptide from Marek's disease virus glycoprotein gB and Marek's disease virus glycoprotein gA and further comprising foreign DNA encoding Newcastle disease virus fusion (F) protein. Preferably, this recombinant herpesvirus of turkeys is designated S-HVT-048.

The invention further provides recombinant herpesvirus

of turkeys whose genomic DNA contains foreign DNA encoding Marek's disease virus glycoprotein gB and Marek's disease virus glycoprotein gA and further comprising foreign DNA encoding Newcastle disease virus hemagglutinin-neuraminidase (HN). Preferably, this recombinant herpesvirus of turkeys is designated S-HVT-049.

The invention further provides recombinant herpesvirus of turkeys whose genomic DNA contains foreign DNA encoding Marek's disease virus glycoprotein gB and Marek's disease virus glycoprotein gA and further comprising foreign DNA encoding Newcastle disease virus fusion (F) protein and Newcastle disease virus hemagglutinin-neuraminidase (HN). Preferably, this recombinant herpesvirus of turkeys is designated S-HVT-050.

S-HVT-050 has been deposited on February 23, 1993 pursuant to the Budapest Treaty on the International Deposit of Microorganisms for the Purpose of Patent Procedure with the Patent Culture Depository of the American Type Culture Collection, 12301 Parklawn Drive, Rockville, Maryland 20852 U.S.A. under ATCC Accession No. VR. 2400.

In yet another embodiment of the invention, the recombinant HVT contains foreign DNA sequence encoding MDV gB, MDV gA, MDV gD, NDV F and NDV HN. Preferably, such recombinant HVT is designated S-HVT-106 or S-HVT 128.

The invention further provides recombinant herpesvirus. Further, in one embodiment the foreign DNA sequence encodes the antigenic polypeptide from an infectious laryngotracheitis virus and encodes infectious laryngotracheitis virus glycoprotein gB, infectious

laryngotracheitis virus glycoprotein gI or infectious laryngotracheitis virus glycoprotein gD.

5 In another embodiment the foreign DNA sequence encodes an antigenic polypeptide which is derived or derivable from a group consisting of: MDV gA, MDV gB, MDV gD, NDV HN, NDV F, ILT gB, ILT gI, ILT gD, IBV, IBDV VP2, IBDV VP3, IBDV VP4, avian encephalomyelitis virus, avian reovirus, avian paramyxovirus, avian influenza virus, 10 avian adenovirus, fowl pox virus, avian coronavirus, avian rotavirus, chick anemia virus (agent), *Salmonella spp.*, *E. coli*, *Pasteurella spp.*, *Bordetella spp.*, *Eimeria spp.*, *Histomonas spp.*, *Trichomonas spp.*, Poultry nematodes, cestodes, trematodes, poultry 15 mites/lice, poultry protozoa.

The invention further provides a recombinant herpesvirus of turkeys which contains a foreign DNA sequence encoding an antigenic polypeptide from 20 infectious laryngotracheitis virus. It is preferred that the antigenic polypeptide is ILTV glycoprotein gB, ILTV gD or ILTV gI.

Also provided are recombinant HVTs which are engineered 25 to contain more than one foreign DNA sequence encoding an ILTV antigen. For example, ILTV gB and gD can be vectored together into the HVT genome, so can ILTV gD and gI, and ILTV gB, gD and gI. Recombinant HVT designated S-HVT-051, S-HVT-052, and S-HVT-138 are 30 embodiments of such recombinant virus.

The present invention also provides a recombinant HVT which contains more than one foreign DNA sequence encoding an antigenic polypeptide from MDV as well as 35 one or more foreign DNA sequences encoding an antigenic polypeptide from ILTV. Preferably, the MDV antigenic polypeptide is MDV gB, gD or gA and the ILTV antigenic

polypeptide is ILTV gB, gD or gI.

In one embodiment of the invention, the recombinant HVT contains foreign DNA sequences encoding MDV gB, MDV gA, MDV gD, ILTV gD and ILTV gB. Preferably, this recombinant HVT is designated S-HVT-123.

In another embodiment of this invention, the recombinant HVT contains foreign DNA sequences encoding MDV gB, MDV gA, MDV gD, ILTV gB and ILTV gD. Preferably, this recombinant HVT is designated S-HVT-139 or S-HVT-140.

The invention further provides recombinant herpesvirus of turkeys whose genomic DNA contains foreign DNA encoding Marek's disease virus glycoprotein gB, Marek's disease virus glycoprotein gA, and Marek's disease virus glycoprotein gD and further comprising foreign DNA which encodes infectious laryngotracheitis virus glycoprotein gD, infectious laryngotracheitis virus glycoprotein gB, and *E. coli*  $\beta$ -galactosidase. Preferably, this recombinant herpesvirus of turkeys is designated S-HVT-104.

The invention further provides recombinant herpesvirus of turkeys whose genomic DNA contains foreign DNA encoding infectious bronchitis virus spike protein or infectious bronchitis virus matrix protein.

The present invention further provides a recombinant HVT which contains a foreign DNA sequence encoding an antigenic polypeptide from infectious bronchitis virus (IBV). Preferably, the antigenic polypeptide is IBV spike protein or IBV matrix protein.

The present invention also provides a recombinant HVT which contains one or more foreign DNA sequences

encoding an antigenic polypeptide from IBV as well as one or more foreign DNA sequences encoding an antigenic polypeptide from MDV. Preferably, the IBV antigenic polypeptide is IBV spike protein or IBV matrix protein, and the MDV antigenic polypeptide is MDV gB, gD or gA. One embodiment of such recombinant virus is designated S-HVT-066.

The invention further provides a recombinant herpesvirus of turkeys whose genomic DNA contains foreign DNA encoding antigenic polypeptide from infectious bursal disease virus and further comprising foreign DNA encoding a polypeptide which is a detectable marker.

Further, in one embodiment a foreign DNA sequence encoding the antigenic polypeptide is from infectious bursal disease virus. In another embodiment the foreign DNA sequence encodes infectious bursal disease virus VP2 gene. In another embodiment the foreign DNA sequence encodes infectious bursal disease virus VP3 gene. In another embodiment the foreign DNA sequence encodes infectious bursal disease virus VP4 gene. Preferably, this recombinant herpesvirus of turkeys is designated S-HVT-003 or S-HVT-096.

Recombinant HVT designated S-HVT-003 and S-HVT-096 are each an embodiment of a recombinant HVT comprising foreign DNA sequence encoding antigenic polypeptide from IBDV and encoding a detectable marker. S-HVT-003 has been deposited on July 21, 1987 pursuant to the Budapest Treaty on the International Deposit of Microorganism for the Purposes of Patent Procedure with the Patent Culture Depository of the American Type Culture Collection, 12301 Parklawn Drive, Rockville, Maryland 20852 U.S.A. under ATCC Accession No. VR. 2178.

This invention provides a recombinant herpesvirus of turkeys containing a foreign DNA sequence inserted into the EcoR1 #9 fragment herpesvirus of turkeys viral genome wherein the foreign DNA sequence is from an infectious laryngotracheitis virus and encodes infectious laryngotracheitis virus glycoprotein gB, or infectious laryngotracheitis virus glycoprotein gD.

In one embodiment the foreign DNA sequence is from an infectious laryngotracheitis virus and encodes infectious laryngotracheitis virus glycoprotein gD, or laryngotracheitis virus glycoprotein gI.

This invention provides a recombinant herpesvirus of turkeys containing a foreign DNA sequence inserted into the EcoR1 #9 fragment herpesvirus of turkeys viral genome wherein the foreign DNA sequence is from an Newcastle disease virus and encodes a Newcastle disease virus HN or Newcastle disease virus F.

This invention provides a recombinant herpesvirus of turkeys containing a foreign DNA sequence inserted into the EcoR1 #9 fragment herpesvirus of turkeys viral genome wherein the foreign DNA sequence is from an infectious bursal virus and encodes an infectious bursal disease virus VP2, VP3, VP4.

This invention provides a recombinant herpesvirus of turkeys containing a foreign DNA sequence inserted into the EcoR1 #9 fragment herpesvirus of turkeys viral genome wherein the foreign DNA sequence is from an infectious bronchitis virus and encodes an infectious bronchitis virus matrix protein.

In another embodiment a foreign DNA sequence encodes an antigenic polypeptide which is derived or derivable from a group consisting of: MDV gA, MDV gB, MDV gD, NDV

HN, NDV F, ILT gB, ILT gI, ILT gD, IBV, IBDV VP2, IBDV  
VPD3, IBDV VP4, avian encephalomyelitis virus, avian  
reovirus, avian paramyxovirus, avian influenza virus,  
avian adenovirus, fowl pox virus, avian coronavirus,  
5 avian rotavirus, chick anemia virus (agent), *Salmonella*  
*spp.*, *E. coli*, *Pasteurella spp.*, *Bordetella spp.*,  
*Eimeria spp.*, *Histomonas spp.*, *Trichomonas spp.*,  
Poultry nematodes, cestodes, trematodes, poultry  
mites/lice, poultry protozoa. In a preferred embodiment  
10 the recombinant herpesvirus of turkeys is designated S-  
HVT-136.

Such antigenic polypeptide may be derived or derivable  
from the following: feline pathogen, canine pathogen,  
15 equine pathogen, bovine pathogen, avian pathogen,  
porcine pathogen, or human pathogen.

In another embodiment, the antigenic polypeptide of a  
human pathogen is derived from human herpesvirus,  
20 herpes simplex virus-1, herpes simplex virus-2, human  
cytomegalovirus, Epstein-Barr virus, Varicell-Zoster  
virus, human herpesvirus-6, human herpesvirus-7, human  
influenza, human immunodeficiency virus, rabies virus,  
measles virus, hepatitis B virus and hepatitis C virus.  
25 Furthermore, the antigenic polypeptide of a human  
pathogen may be associated with malaria or malignant  
tumor from the group consisting of *Plasmodium*  
*falciparum*, *Bordetella pertussis*, and malignant tumor.

30 The invention further provides recombinant herpes virus  
of turkeys whose genomic DNA contains foreign DNA  
encoding Newcastle disease virus fusion (F) protein and  
further comprising foreign DNA encoding a recombinant  
protein, wherein *E. coli* B-galactosidase is fused to  
35 Newcastle disease virus hemagglutinin-neuraminidase  
(HN).

The invention further provides recombinant herpesvirus of turkeys whose genomic DNA contains foreign DNA encoding Marek's disease virus glycoprotein gB and Marek's disease virus glycoprotein gA and further comprising foreign DNA encoding Newcastle disease virus hemagglutinin-neuraminidase (HN).

This invention provides a recombinant herpesvirus of turkeys-Marek's disease virus chimera comprising a herpesvirus of turkeys unique long viral genome region and a Marek's disease virus unique short region. In one embodiment the recombinant herpesvirus of turkeys-Marek's disease virus chimera contains a foreign DNA sequence inserted within the EcoRI #9 fragment of the herpesvirus of turkeys viral genome, and the foreign DNA sequence capable of being expressed in a host cell infected with the herpesvirus of turkeys.

In one embodiment the recombinant herpesvirus of turkeys contains a foreign DNA sequence which encodes a polypeptide. The polypeptide may be antigenic in an animal into which the recombinant herpesvirus is introduced.

In another embodiment the polypeptide is *E. coli* beta-galactosidase. In another embodiment the foreign DNA sequence encodes a cytokine. In another embodiment the cytokine is chicken myelomonocytic growth factor (cMGF) or chicken interferon (cIFN).

The invention further provides recombinant herpesvirus of turkeys where the foreign DNA sequence encodes a polypeptide which is antigenic in an animal into which the recombinant herpesvirus is introduced.

Further, the recombinant herpesvirus of turkeys further comprises a foreign DNA sequence encoding the antigenic

polypeptide selected from the group consisting of: Marek's disease virus, Newcastle disease virus, infectious laryngotracheitis virus, infectious bronchitis virus and infectious bursal disease virus.

5

This invention provides a recombinant herpesvirus of turkeys wherein the foreign DNA sequence is under control of an endogenous upstream herpesvirus promoter. In one embodiment the foreign DNA sequence is under control of a heterologous upstream promoter. In another embodiment the promoter is selected from PRV gX, HSV-1 alpha 4, HCMV immediate early, MDV gA, MDV gB, MDV gD, ILT gB, BHV-1.1 VP8 and ILT gD.

10

15

20

25

30

This invention provides a homology vector for producing a recombinant herpesvirus of turkeys by inserting foreign DNA into the viral genome of a herpesvirus of turkey which comprises a double-stranded DNA molecule consisting essentially of: a) double stranded foreign DNA not usually present within the herpesvirus of turkeys viral genome; b) at one end the foreign DNA, double-stranded herpesvirus of turkeys DNA homologous to the viral genome located at one side of the EcoR1 #9 site the coding region of the herpesvirus of turkeys viral genome; and c) at the other end of the foreign DNA, double-stranded herpesvirus of turkeys DNA homologous to the viral genome located at the other side of the EcoR1 #9 fragment of the coding region of the herpesvirus of turkeys viral genome. Examples of the homology vectors are designated 751-87.A8 and 761-7.A1.

35

In one embodiment the polypeptide is antigenic in the animal into which the recombinant herpesvirus of turkeys is introduced. In another embodiment the antigenic polypeptide is from a cytokine, Marek's disease virus, Newcastle disease virus, infectious

laryngotracheitis virus, or infectious bronchitis virus. In a preferred embodiment the antigenic polypeptide is a chicken myelomonocytic growth factor (cMGF) or chicken interferon (cIFN), infectious bursal disease virus polyprotein, infectious bursal disease virus VP2 protein, Marek's disease virus glycoprotein gB, Marek's disease virus glycoprotein gA, Marek's disease virus glycoprotein gD, Newcastle disease virus fusion protein, Newcastle disease virus hemagglutinin-neuraminidase, infectious laryngotracheitis virus glycoprotein gB, infectious laryngotracheitis virus glycoprotein gD, infectious bronchitis virus spike protein, or infectious bronchitis virus matrix protein.

15 In another embodiment the double stranded foreign DNA sequence in the homology vector encodes an antigenic polypeptide derived from an equine pathogen. The antigenic polypeptide of an equine pathogen can be derived from equine influenza virus or equine herpesvirus. 20 Examples of such antigenic polypeptide are equine influenza virus type A/Alaska 91 neuraminidase, equine influenza virus type A/Prague 56 neuraminidase, equine influenza virus type A/Miami 63 neuraminidase, equine influenza virus type A/Kentucky 81 neuraminidase, equine herpesvirus type 1 glycoprotein B, and equine herpesvirus type 1 glycoprotein D. 25

In another embodiment the double stranded foreign DNA sequence of the homology vector encodes an antigenic polypeptide derived from bovine respiratory syncytial virus or bovine parainfluenza virus. The antigenic polypeptide of derived from bovine respiratory syncytial virus equine pathogen can be derived from equine influenza virus is bovine respiratory syncytial virus attachment protein (BRSV G), bovine respiratory syncytial virus fusion protein (BRSV F), bovine respiratory syncytial virus nucleocapsid protein (BRSV 30 35

N), bovine parainfluenza virus type 3 fusion protein, and the bovine parainfluenza virus type 3 hemagglutinin neuraminidase.

5 In another embodiment the double stranded foreign DNA sequence in the homology vector encodes a cytokine capable of stimulating human immune response. For example, the cytokine may be, but is not limited to, interleukin-2, interleukin-6, interleukin-12,  
10 interferons, granulocyte-macrophage colony stimulating factors, and interleukin receptors.

In one embodiment of the invention, the double-stranded herpesvirus of turkeys DNA is homologous to DNA  
15 sequences present within the *Bam*HI #16 fragment of the herpesvirus of turkeys genome. Preferably, the double-stranded herpesvirus of turkeys DNA is homologous to DNA sequences present within the open reading frame encoding UL 43 protein of the herpesvirus of turkeys  
20 genome. Preferably, this homology vector is designated 172-29.31.

For purposes of this invention, a "homology vector" is a plasmid constructed to insert foreign DNA in a  
25 specific site on the genome of a herpesvirus of turkeys.

In one embodiment of the invention, the double-stranded herpesvirus of turkeys DNA is homologous to DNA  
30 sequences present within the *Eco*R1 #9 fragment of the herpesvirus of turkeys genome. Preferably, this homology vector is designated 172-63.1.

In one embodiment of the invention, the double-stranded herpesvirus of turkeys DNA is homologous to DNA  
35 sequences present within the US2 gene coding region of the herpesvirus of turkeys genome. Preferably, this

homology vector is designated 435-47.1.

5 In another embodiment the foreign DNA sequence encodes a screenable marker. Examples of screenable markers, include but are not limited to: *E. coli* B-galactosidase or *E. coli* B-glucuronidase.

10 The invention further provides a vaccine which comprises an effective immunizing amount of a recombinant herpesvirus of turkeys of the present invention and a suitable carrier.

15 This invention provides a vaccine useful for immunizing a bird against Marek's disease virus which comprises an effective immunizing amount of the recombinant herpesvirus of turkeys and a suitable carrier.

20 This invention provides a vaccine useful for immunizing a bird against Newcastle disease virus which comprises an effective immunizing amount of the recombinant herpesvirus of turkeys and a suitable carrier.

25 This invention provides a vaccine useful for immunizing a bird against infectious laryngotracheitis virus which comprises an effective immunizing amount of the recombinant herpesvirus of turkeys and a suitable carrier.

30 This invention provides a vaccine useful for immunizing a bird against infectious bronchitis virus which comprises an effective immunizing amount of the recombinant herpesvirus of turkeys and a suitable carrier.

35 This invention provides a vaccine useful for immunizing a bird against infectious bursal disease virus which comprises an effective immunizing amount of the

recombinant herpesvirus of turkeys and a suitable carrier.

5 This invention provides a multivalent vaccine useful for immunizing a bird against Marek's disease virus and Newcastle disease virus which comprises an effective immunizing amount of the recombinant herpesvirus of turkeys.

10 This invention provides a multivalent vaccine useful for immunizing a bird against Marek's disease virus and infectious laryngotracheitis virus which comprises an effective immunizing amount of the recombinant herpesvirus of turkeys and a suitable carrier.

15 This invention provides a multivalent vaccine useful for immunizing a bird against Marek's disease virus and infectious bronchitis virus which comprises an effective immunizing amount of the recombinant  
20 herpesvirus of turkeys and a suitable carrier.

This invention provides a multivalent vaccine useful for immunizing a bird against Marek's disease virus and infectious bursal disease virus which comprises an  
25 effective immunizing amount of the recombinant herpesvirus of turkeys and a suitable carrier.

The present invention also provides a method of immunizing a fowl. For purposes of this invention,  
30 this includes immunizing a fowl against infectious bursal disease virus, Marek's disease virus, Newcastle disease virus, infectious laryngotracheitis virus, or infectious bronchitis virus. The method comprises administering to the fowl an effective immunizing dose  
35 of the vaccine of the present invention. The vaccine may be administered by any of the methods well known to those skilled in the art, for example, by

intramuscular, subcutaneous, intraperitoneal or intravenous injection. Alternatively, the vaccine may be administered intranasally or orally.

5 This invention provides a host cell infected with the recombinant herpesvirus of turkey. In one embodiment the host cell is an avian cell.

10 For purposes of this invention, a "host cell" is a cell used to propagate a vector and its insert. Infecting the cell was accomplished by methods well known to those skilled in the art, for example, as set forth in DNA TRANSFECTION FOR GENERATING RECOMBINANT HERPESVIRUS in Materials and Methods. Methods for constructing,  
15 selecting and purifying recombinant herpesvirus of turkeys are detailed below in .

This invention provides a method of distinguishing chickens or other poultry which are vaccinated with the  
20 above vaccine from those which are infected with a naturally-occurring Marek's disease virus which comprises analyzing samples of body fluids from chickens or other poultry for the presence of glycoprotein gG and at least one other antigen normally  
25 expressed in chickens or other poultry infected by a naturally-occurring Marek's disease virus, the presence of those antigens normally expressed in infected chickens but the absence of glycoprotein gG being indicative of vaccination with the above vaccine and  
30 not infection with a naturally-occurring Marek's disease virus.

This invention provides a recombinant herpesvirus of turkeys which expresses foreign DNA sequences is useful  
35 as vaccines in avian or mammalian species including but not limited to chickens, turkeys, ducks, feline, canine, bovine, equine, and primate, including human.

This vaccine may contain either inactivated or live recombinant virus.

5 For purposes of this invention, an "effective immunizing amount" of the recombinant feline herpes virus of the present invention is within the range of  $10^3$  to  $10^9$  PFU/dose. In another embodiment the immunizing amount is  $10^5$  to  $10^7$  PFU/dose. In a preferred embodiment the immunizing amount is  $10^6$  PFU/dose.

10 The method comprises administering to the animal an effective immunizing dose of the vaccine of the present invention. The vaccine may be administered by any of the methods well known to those skilled in the art, for example, by intramuscular, subcutaneous, intraperitoneal or intravenous injection. Alternatively, the vaccine may be administered intranasally or orally.

20 Suitable carriers for the recombinant virus are well known to those skilled in the art and include but are not limited to proteins, sugars, etc. One example of such a suitable carrier is a physiologically balanced culture medium containing one or more stabilizing agents such as hydrolyzed proteins, lactose, etc. Preferably, the live vaccine is created by taking tissue culture fluids and adding stabilizing agents such as stabilizing, hydrolyzed proteins. Preferably, 25 the inactivated vaccine uses tissue culture fluids directly after inactivation of the virus.

30 This invention is further illustrated in the Experimental Details section which follows. This section is set forth to aid in an understanding of the invention but is not intended to, and should not be construed to, limit in any way the invention as set 35

forth in the claims which follow thereafter.

EXPERIMENTAL DETAILS:Materials and Methods

5

PREPARATION OF HERPESVIRUS OF TURKEYS STOCK SAMPLES.

Herpesvirus of turkeys stock samples were prepared by infecting tissue culture cells at a multiplicity of infection of 0.01 PFU/cell in Dulbecco's Modified Eagle Medium (DMEM) containing 2 mM glutamine, 100 units/ml penicillin, 100 units/ml streptomycin (these components are obtained from Irvine Scientific or an equivalent supplier, and hereafter are referred to as complete DME medium) plus 1% fetal bovine serum. After cytopathic effect was complete, the medium and cells were harvested and the cells were pelleted at 3000 rpm for 5 minutes in a clinical centrifuge. Infected cells were resuspended in complete medium containing 20% fetal bovine serum, 10% DMSO and stored frozen at -70°C.

20

PREPARATION OF HERPESVIRUS OF TURKEY DNA. All manipulations of herpesvirus of turkey (HVT) were made using strain FC-126 (ATCC #584-C). For the preparation of HVT viral DNA from the cytoplasm of infected cells, primary chicken embryo fibroblasts were infected at a MOI sufficient to cause extensive cytopathic effect before the cells overgrew. All incubations were carried out at 39°C in a humidified incubator with 5% CO<sub>2</sub> in air. Best DNA yields were obtained by harvesting monolayers which were maximally infected, but showing incomplete cell lysis (typically 5-7 days). Infected cells were harvested by scraping the cells into the medium using a cell scraper (Costar brand). The cell suspension was centrifuged at 3000 rpm for 10 minutes at 5°C in a GS-3 rotor (Sorvall Instruments). The resultant pellet was resuspended in cold PBS (20

25

30

35

ml/Roller Bottle) and subjected to another centrifugation for 10 minutes at 3000 rpm in the cold. After decanting the PBS, the cellular pellet was resuspended in 4 ml/roller bottle of RSB buffer (10 mM Tris pH 7.5, 1 mM EDTA, and 1.5 mM  $MgCl_2$ ). NP40 (Nonidet P-40<sup>®</sup>;Sigma) was added to the sample to a final concentration of 0.5% minutes with occasional mixing. The sample was centrifuged for 10 minutes at 3000 rpm in the cold to pellet the nuclei and remove cellular debris. The supernatant fluid was carefully transferred to a 15 ml Corex centrifuge tube. Both EDTA (0.5M pH 8.0) and SDS (sodium dodecyl sulfate; stock 20%) were added to the sample to final concentrations of 5 mM and 1%, respectively. One hundred  $\mu$ l of proteinase-K (10 mg/ml; Boehringer Mannheim) was added per 4 ml of sample, mixed, and incubated at 45°C for 1-2 hours. After this period, an equal volume of water-saturated phenol was added to the sample and gently mixed by hand. The sample was spun in a clinical centrifuge for 5 minutes at 3000 rpm to separate the phases. NaAc was added to the aqueous phase to a final concentration of 0.3M (stock solution 3M pH 5.2), and the nucleic acid precipitated at -70°C for 30 minutes after the addition of 2.5 volumes of cold absolute ethanol. DNA in the sample was pelleted by spinning for 20 minutes to 8000 rpm in an HB-4 rotor at 5°C. The supernatant was carefully removed and the DNA pellet washed once with 25 ml of 80% ethanol. The DNA pellet was dried briefly by vacuum (2-3 minutes), and resuspended in 50  $\mu$ l/roller bottle of infected cells of TE buffer (10 mM Tris pH 7.5, 1 mM EDTA). Typically, yields of viral DNA ranged between 5-10  $\mu$ g/roller bottle of infected cells. All viral DNA was stored at approximately 10°C.

35

**POLYMERASE FILL-IN REACTION.** DNA was resuspended in buffer containing 50 mM Tris pH 7.4, 50 mM KCl, 5 mM

MgCl<sub>2</sub>, and 400 micromolar each of the four deoxynucleotides. Ten units of Klenow DNA polymerase (BRL) were added and the reaction was allowed to proceed for 15 minutes at room temperature. The DNA was then phenol extracted and ethanol precipitated as above.

**DNA SEQUENCING.** Sequencing was performed using the USB Sequenase Kit and <sup>35</sup>S-dATP (NEN). Reactions using both the dGTP mixes and the dTTP mixes were performed to clarify areas of compression. Alternatively, compressed areas were resolved on formamide gels. Templates were double-stranded plasmid subclones or single stranded M13 subclones, and primers were either made to the vector just outside the insert to be sequenced, or to previously obtained sequence. Sequence obtained was assembled and compared using Dnastar software. Manipulation and comparison of sequences obtained was performed with Superclone and Supersee programs from Coral Software.

**MOLECULAR BIOLOGICAL TECHNIQUES.** Techniques for the manipulation of bacteria and DNA, including such procedures as digestion with restriction endonucleases, gel electrophoresis, extraction of DNA from gels, ligation, phosphorylation with kinase, treatment with phosphatase, growth of bacterial cultures, transformation of bacteria with DNA, and other molecular biological methods are described by Maniatis et al (1982) and Sambrook et al (1989). The polymerase chain reaction (PCR) was used to introduce restriction sites convenient for the manipulation of various DNAs. The procedures used are described by Innis et al (1990). In general amplified fragments were less than 500 base pairs in size and critical regions of amplified fragments were confirmed by DNA sequencing. Except as noted, these techniques were used with minor

variation.

SOUTHERN BLOTTING OF DNA. The general procedure for Southern blotting was taken from Maniatis et al. (1982). DNA was blotted to nitrocellulose filters (S&S BA85) in 20X SSC (1X ssc = 0.15M NaCl, 0.015M sodium citrate, pH 7.0), and prehybridized in hybridization solution consisting of 30% formamide, 1X Denhardt's solution (0.02% polyvinylpyrrolidone (PVP), 0.02% bovine serum albumin (BSA), 0.02% Ficoll), 6X SSC, 50 mM  $\text{NaH}_2\text{PO}_4$ , pH 6.8, 200  $\mu\text{g/ml}$  salmon sperm DNA for 4-24 hours at 55°C. Labeled probe DNA was added that had been labeled by nick translation using a kit from Bethesda Research Laboratories (BRL) and one  $^{32}\text{P}$ -labeled nucleotide. The probe DNA was separated from the unincorporated nucleotides by NACS column (BRL) or on a Sephadex G50 column (Pharmacia). After overnight hybridization at 55°C, the filter was washed once with 2X SSC at room temperature followed by two washes with 0.1X SSC, 0.1% sodium dodecyl sulfate (SDS) for 30 minutes at 55°C. The filter was dried and autoradiographed.

cDNA CLONING PROCEDURE. cDNA cloning refers to the methods used to convert RNA molecules into DNA molecules following state of the art procedures. Applicants' methods are described in (Gubler and Hoffman, 1983). Bethesda Research Laboratories (Gaithersburg, MD) have designed a cDNA Cloning Kit that is very similar to the procedures used by applicants, and contains a set of reagents and protocols that may be used to duplicate our results.

For cloning virus mRNA species, a host cell line sensitive to infection by the virus was infected at 5-10 plaque forming units per cell. When cytopathic effect was evident, but before total destruction, the

medium was removed and the cells were lysed in 10 mls lysis buffer (4 M guanidine thiocyanate, 0.1% antifoam A, 25 mM sodium citrate pH 7.0, 0.5% N-lauroyl sarcosine, 0.1 M beta-mercaptoethanol). The cell lysate was poured into a sterilized Dounce homogenizer and homogenized on ice 8-10 times until the solution was homogenous. For RNA purification, 8 mls of cell lysate were gently layered over 3.5 mls of CsCl solution (5.7 M CsCl, 25 mM sodium citrate pH 7.0) in Beckman SW41 centrifuge tube. The samples were centrifuged for 18 hrs at 20° C at 36000 rpm in a Beckman SW41 rotor. The tubes were put on ice and the supernatants from the tubes were carefully removed by aspiration to leave the RNA pellet undisturbed. The pellet was resuspended in 400 µl glass distilled water, and 2.6 mls of guanidine solution (7.5 M guanidine-HCL, 25 mM sodium citrate pH 7.0, 5 mM dithiothreitol) were added. The 0.37 volumes of 1 M acetic acid were added, followed by 0.75 volumes of cold ethanol and the sample was put at -20° C for 18 hrs to precipitate RNA. The precipitate was collected by centrifugation in a Sorvall centrifuge for 10 min at 4° C at 10000 rpm in an SS34 rotor. The pellet was dissolved in 1.0 ml distilled water, recentrifuged at 13000 rpm, and the supernatant saved. RNA was re-extracted from the pellet 2 more times as above with 0.5 ml distilled water, and the supernatants were pooled. A 0.1 volume of 2 M potassium acetate solution was added to the sample followed by 2 volumes of cold ethanol and the sample was put at -20° C for 18 hrs. The precipitated RNA was collected by centrifugation in the SS34 rotor at 4° C for 10 min at 10000 rpm. The pellet was dissolved in 1 ml distilled water and the concentration taken by absorption at A260/280. The RNA was stored at -70°C.

mRNA containing polyadenylate tails (poly-A) was

selected using oligo-dT cellulose (Pharmacia #27 5543-0). Three mg of total RNA was boiled and chilled and applied to the 100 mg oligo-dT cellulose column in binding buffer (0.1 M Tris pH 7.5, 0.5 M LiCl, 5mM EDTA pH 8.0, 0.1% lithium dodecyl sulfate). The retained poly-A RNA was eluted from the column with elution buffer (5mM Tris pH 7.5, 1mM EDTA pH 8.0, 0.1% sodium dodecyl sulfate). This mRNA was reapplied to an oligo-dT column in binding buffer and eluted again in elution buffer. The sample was precipitated with 200 mM sodium acetate and 2 volumes cold ethanol at -20°C for 18 hrs. The RNA was resuspended in 50 µl distilled water.

Ten µg poly-A RNA was denatured in 20 mM methyl mercury hydroxide for 6 min at 22°C. β-mercaptoethanol was added to 75 mM and the sample was incubated for 5 min at 22°C. The reaction mixture for first strand cDNA synthesis in 0.25 ml contained 1 µg oligo-dT primer (P-L Bio-chemicals) or 1 µg synthetic primer, 28 units placental ribonuclease inhibitor (Bethesda Research Labs #5518SA), 100 mM Tris pH 8.3, 140 mM KCl, 10mM MgCl<sub>2</sub>, 0.8 mM dATP, dCTP, dGTP, and dTTP (Pharmacia), 100 microcuries <sup>32</sup>p-labeled dCTP (New England Nuclear #NEG-013H), and 180 units AMV reverse transcriptase (Molecular Genetics Resources #MG 101). The reaction was incubated at 42°C for 90 min, and then was terminated with 20mM EDTA pH 8.0. The sample was extracted with an equal volume of phenol/chloroform (1:1) and precipitated with 2 M ammonium acetate and 2 volumes of cold ethanol -20°C for 3 hrs. After precipitation and centrifugation, the pellet was dissolved in 100 µl distilled water. The sample was loaded onto a 15 ml G-100 Sephadex column (Pharmacia) in buffer (100 mM Tris pH 7.5, 1 mM EDTA pH 8.0, 100 mM NaCl). The leading edge of the eluted DNA fractions was pooled, and DNA was concentrated by lyophilization until the volume was about 100 µl, then the DNA was

precipitated with ammonium acetate plus ethanol as above.

5 The entire first strand sample was used for second strand reaction which followed the Gubler and Hoffman (1983) method except that 50  $\mu\text{g/ml}$  dNTP's, 5.4 units DNA polymerase I (Boehringer Mannheim #642-711), and 100 units/ml *E. coli* DNA ligase (New England Biolabs #205) in a total volume of 50 microliters were used.  
10 After second strand synthesis, the cDNA was phenol/chloroform extracted and precipitated. The DNA was resuspended in 10  $\mu\text{l}$  distilled water, treated with 1  $\mu\text{g}$  RNase A for 10 min at 22°C, and electrophoresed through a 1% agarose gel (Sigma Type II agarose) in 40 mM Tris-acetate pH 6.85. The gel was stained with  
15 ethidium bromide, and DNA in the expected size range was excised from the gel and electroeluted in 8 mM Tris-acetate pH 6.85. Electroeluted DNA was lyophilized to about 100 microliters, and precipitated  
20 with ammonium acetate and ethanol as above. The DNA was resuspended in 20  $\mu\text{l}$  water.

Oligo-dC tails were added to the DNA to facilitate cloning. The reaction contained the DNA, 100 mM  
25 potassium cacodylate pH 7.2, 0.2 mM dithiothreitol, 2mM  $\text{CaCl}_2$ , 80  $\mu\text{moles}$  dCTP, and 25 units terminal deoxynucleotidyl transferase (Molecular Genetic Resources #S1001) in 50  $\mu\text{l}$ . After 30 min at 37°C, the  
30 reaction was terminated with 10mM EDTA, and the sample was phenol/chloroform extracted and precipitated as above.

The dC-tailed DNA sample was annealed to 200 ng plasmid vector pBR322 that contained oligo-dG tails (Bethesda  
35 Research Labs #5355 SA/SB) in 200  $\mu\text{l}$  of 0.01 M Tris pH 7.5, 0.1 M NaCl, 1 mM EDTA pH 8.0 at 65°C for 2 min and then 57°C for 2 hrs. Fresh competent *E. coli* DH-1

cells were prepared and transformed as described by Hanahan (1983) using half the annealed cDNA sample in twenty 200  $\mu$ l aliquots of cells. Transformed cells were plated on L-broth agar plates plus 10  $\mu$ g/ml tetracycline. Colonies were screened for the presence of inserts into the ampicillin gene using Ampscreen (Bethesda Research Labs #5537 UA), and the positive colonies were picked for analysis.

10     **DNA TRANSFECTION FOR GENERATING RECOMBINANT**  
          **HERPESVIRUS.** The method is based upon the polybrene-DMSO procedure of Kawai and Nishizawa (1984) with the following modifications. Generation of recombinant HVT virus is dependent upon homologous recombination  
15     between HVT viral DNA and the plasmid homology vector containing the desired foreign DNA flanked by the appropriate herpesvirus cloned sequences. Transfections were carried out in 6 cm plates (Corning plastic) of 50% confluent primary chick embryo  
20     fibroblast (CEF) cells. The cells were plated out the day before in CEF growth media (1X F10/199, 5% fetal calf serum, 2% glutamine, 1% non-essential amino acids, and 2% penicillin/streptomycin) containing 4  $\mu$ g/ml polybrene (stock 4 mg/ml in 1X HBSS). For  
25     cotransfections into CEF cells, 5  $\mu$ g of intact HVT DNA, and suspended in 1 ml of CEF media containing 30  $\mu$ g/ml polybrene (stock 4 mg/ml in 1X HBSS). The DNA-polybrene suspension (1 ml) was then added to a 6 cm plate of CEF cells from which the media had been  
30     aspirated, and incubated at 39°C for 30 minutes. The plates were rocked periodically during this time to redistribute the inoculum. After this period, 4 ml of CEF growth media was added directly to wash plate, and incubated an additional 2.5 hours at 39°C. At this  
35     time, the media was removed from each plate, and the cells shocked with 2 ml of 30% DMSO (Dimethyl Sulfoxide, J.T. Baker Chemical Co.) in 1X HBSS for 4

minutes at room temperature. The 30% DMSO was carefully removed and the monolayers washed once with 1X HBSS at room temperature. The cells were then incubated at 39°C after the addition of 5 mls of CEF growth media. The next day, the media was changed to remove any last traces of DMSO and to stimulate cell growth. Cytopathic effect from the virus becomes apparent within 6 days. Generation of a high titer stock (80%-90% CPE) can usually be made within 1 week from this date. HVT stock samples were prepared by resuspending the infected cells in CEF growth media containing 20% fetal calf serum, 10% DMSO and stored at -70°C.

**PROCEDURE FOR GENERATING RECOMBINANT HERPESVIRUS FROM SUBGENOMIC DNA FRAGMENTS.** The ability to generate herpesviruses by cotransfection of cloned overlapping subgenomic fragments has been demonstrated for pseudorabies virus (Zijl et al., 1988). If deletions and/or insertions are engineered directly into the subgenomic fragments prior to the cotransfection, this procedure results in a high frequency of viruses containing the genomic alteration, greatly reducing the amount of screening required to purify the recombinant virus. This procedure was used to construct recombinant HVT.

A library of subclones containing overlapping HVT subgenomic fragments was generated as follows. HVT DNA was obtained from the American Type Culture Collection (FC-126("Calnek")). It was sheared and then size selected on a glycerol gradient as described by van Zijl et al., (1988) with 40-50 kb fragments chosen as the insert population. The pooled fractions were diluted twofold with TE, one-tenth volume of 3M NaAc and 2.5 volumes of ethanol were added, and the DNA was precipitated at 30K rpm in a Beckman SW41 rotor for 1

hr. The sheared fragments were given blunt ends by initial treatment with T4 DNA polymerase, using low dNTP concentrations to promote 3' overhang removal, followed by treatment with Klenow polymerase to fill in recessed 3' ends. These insert fragments were then ligated to a pWE15 (Stratagene) cosmid vector, which had been digested with *Bam*HI, treated with calf intestinal phosphatase, and made blunt by treatment with Klenow polymerase. The ligated mixture was then packaged using Gigapack XL packaging extracts (Stratagene). Ligation and packaging was as recommended by the manufacturer.

Published restriction maps for the enzymes *Bam*HI, *Hind*III, and *Xho*I permitted the use of subcloned fragments as specific probes to screen the cosmid library for subclones spanning the genome. Probes were generated from subcloned restriction fragments. The fragments were then labeled using a non-radioactive system (Genius, Boehringer Mannheim). Screening was facilitated by picking colonies to media followed by growth overnight. Sets of five filters and a master plate were stamped from microtiter dish and again grown overnight. Glycerol was added to the wells to 15% and the plates were frozen at -20°C to provide stock cultures of each colony. Filters were BioRad Colony Lift Membranes and were treated and hybridized per manufacturer's instructions, and washed in 0.1X SSC, 0.1% SDS, 65°C. Clones which hybridized with the non-radioactive probe were detected according to the Genius kit directions.

Colonies were selected for further analysis on the basis of their hybridization to two or more of the specific probes. These were then digested with *Bam*HI, and compared to published maps of HVT (Buckmaster et al., 1988). The three cosmids (407-32.2C3, 407-32.IG7,

and 407-32.5G6) were obtained in this manner. A detailed description of each clone is given below. It was found that chloramphenicol amplification (Maniatis et al., 1982) was necessary to achieve reasonable yields of DNA from these clones. In addition, one cosmid clone (407-32.5G6) was unstable and had to be grown from the original frozen stock in order to obtain satisfactory DNA preparations.

The pWE15 vector allows the inserts to be excised with NotI. However, four NotI sites are present in the HVT genome, so that inserts spanning these sites cannot be excised with NotI. Two of the NotI sites are present in the BamHI #2 fragment of HVT, this fragment was cloned directly in pSP64. The other two sites are present in the unique short region within the BamHI #1 fragment. This fragment was cloned directly in the pWE15 vector. The three sheared cosmids and the two BamHI fragments cover all but a small portion of the ends of the HVT genome. Because these regions are repeated in the internal portions of the genome, all of the genetic information is available.

A StuI site within the HVT US2 gene was established as a useful site for foreign DNA insertion utilizing the HOMOLOGOUS RECOMBINATION PROCEDURE FOR GENERATING RECOMBINANT HERPESVIRUSES (see Example 6). The HVT US2 gene is located within the BamHI #1 fragment which contains five StuI sites. To facilitate the use of this site for insertion of foreign DNA by the StuI site within the US2 gene was converted to a unique HindIII site. This was accomplished by partially digesting the BamHI #1 subclone with StuI, and then inserting a 10 kb fragment conferring kanomycin resistance (Neo<sup>r</sup>) into the site using HindIII linkers. The kanomycin

resistance gene allowed positive selection of recombinant clones. The Neo<sup>r</sup> fragment was removed by digestion with *HindIII* followed by religation generating clone 430-84.215.

5

DNA was prepared for reconstruction experiments by restriction digestion with enzymes which cut the subclones outside or flanking the HVT insertions. In some instances, one cosmid in a reconstruction was used undigested. Digested DNAs were extracted once with phenol and precipitated with ethanol. DNA was resuspended at a concentration of 0.5 to 1 ug/ml. Viral reconstruction experiments were performed using Lipofectin (BRL) to mediate transfection. Two to three micrograms each of subclone were added to 0.5 ml of MEM media (Earle's salts) supplemented with 1% non-essential amino acids and 2% penicillin/Streptomycin (MEM+). Controls consisted of MEM+ with no DNA, with several ug of HVT DNA, or with 4 out of 5 of the subclones. Separately, 30  $\mu$ l of the Lipofectin were added to another 0.5 ml. of MEM+. These two mixtures were then combined and incubated at RT for 15 minutes.

Chick embryo fibroblast (CEF) cells were prepared for transfection in the following manner. CEFs (Spafas) were grown in 6 well dishes at 39°C in F10/M199 (1:1) media containing 1% non-essential amino acids, 2% penicillin/streptomycin, and 5% fetal calf serum (CEF+). Cells were transfected at a confluence of 90 - 95%. For transfection, wells were aspirated and rinsed 3 times with MEM+, and then incubated 4 hours at 39°C with the 1 ml lipofectin/DNA mixture above. One ml more of CEF+ was then added to the wells, and cells were incubated overnight and fed with CEF+. Plates were then examined daily for the appearance of plaques.

Lipofectin with control HVT DNA resulted in the

appearance of plaques within 5 days. When only four of the five subclones were used, no plaques were obtained. When the five overlapping genomic fragments of HVT were used to reconstruct the virus, plaques appeared anywhere from 5 to 19 days after the initial lipofection. In the case of plaques appearing late, plaques were not initially seen on the infected monolayer, and it was only after passaging the monolayer and replating on a larger surface that plaques appeared. After passaging, plaques generally appeared within 3 days. Recombinant viruses were plaque purified approximately three and then analyzed for insertion of foreign DNAs.

**BLUOGAL SCREEN FOR RECOMBINANT HERPESVIRUS.** When the foreign gene encoded the enzyme  $\beta$ -galactosidase, the plaques that contained the gene were visualized more easily. The chemical Bluogal™ (Bethesda Research Labs) was incorporated at the level of 200-300  $\mu$ g/ml into the agarose overlay during the plaque assay, and the plaques that expressed active  $\beta$ -galactosidase turned blue. The blue plaques were then picked and purified by further blue plaque isolations. Other foreign genes were inserted by homologous recombination such that they replaced the  $\beta$ -galactosidase gene; in this instance non-blue plaques were picked for purification of the recombinant virus.

**SCREEN FOR FOREIGN GENE EXPRESSION IN RECOMBINANT HVT USING BLACK PLAQUE ASSAYS.** To analyze expression of foreign antigens expressed by recombinant HVT viruses, monolayers of CEF cells are infected with recombinant HVT, overlaid with nutrient agarose media and incubated for 4-5 days at 39°C. Once plaques have developed, the agarose overlay is removed from the dish, the monolayer rinsed 1x with PBS, fixed with 100% methanol for 10 minutes at room temperature and the cells air dried.

After re-hydrating the plate with PBS, the primary antibody is diluted to the appropriate dilution with PBS and incubated with the cell monolayer for 2 hours to overnight at room temperature. Unbound antibody is then removed from the cells by washing three times with PBS at room temperature. An alkaline phosphatase conjugated secondary antibody is diluted with PBS and incubated with the cells for 2 hours at room temperature. Unbound secondary antibody is then removed by washing the cells three times with PBS at room temperature. Next, the monolayer is rinsed in color development buffer (100mM Tris pH 9.5/ 100mM NaCl/ 5mM MgCl<sub>2</sub>), and then incubated 10 minutes to overnight at room temperature with freshly prepared substrate solution (0.3 mg/ml Nitro Blue tetrazolium + 0.15 mg/ml 5-Bromo-4-Chloro-3-Indolyl Phosphatase in color development buffer.) Finally, the reaction is stopped by replacing the substrate solution with TE (10mM Tris, pH7.5/ 1 mM EDTA). Plaques expressing the correct antigen will stain black.

**PLAQUE HYBRIDIZATION PROCEDURE FOR ASSESSING THE PURITY OF RECOMBINANT HVT STOCKS.** When no suitable immunological reagent exists to detect the presence of a particular antigen in a recombinant HVT virus, plaque hybridization can be used to assess the purity of a stock. Initially, CEF cell monolayers are infected with various dilutions of the viral stocks to give ~50-100 plaques/10 cm.dish, overlaid with nutrient agarose media and incubated for 4-5 days at 39°C. Once plaque development occurs, the position of each plaque is marked on bottom of the dish. The agarose overlay is then removed, the plate washed with PBS, and the remaining CEF monolayer is transferred to a NC membrane or BioRad nylon membrane pre-wetted with PBS (making note of the membrane position relative to the dish). Cells contained on the NC membranes are then lysed by

placing the membranes in 1.5 mls of 1.5M NaCl and 0.5M NaOH for five minutes. The membranes are neutralized by placing them in 1.5 mls of 3M Sodium acetate (pH 5.2) for five minutes. DNA from the lysed cells is then bound to the NC membranes by baking at 80°C for one hour. After this period the membranes are prehybridized in a solution containing 6X SSC, 3% skim milk, 0.5% SDS, ( $\pm$ ) salmon sperm DNA (50  $\mu$ g/ml) for one hour at 65°C. Radio-labeled probe DNA (alpha 32P-dCTP) is then added and the membranes incubated at 65°C overnight (~12 hours). After hybridization the NC membranes are washed two times (30 minutes each) with 2X SSC at 65°C, followed by two additional washes at 65°C with 0.5X SSC. The NC membranes are then dried and exposed to X-ray film (Kodak X-OMAT,AR) at -70°C for 12 hours. Positive signals are then aligned with the position of the plaques on the dish and purity of the stock is recorded as the percentage of positive plaques over the total.

**CONSTRUCTION OF HOMOLGY VECTOR FOR INSERTION OF THE BETA-GALACTOSIDASE GENE INTO HVT US2 GENE.** The beta-galactosidase (*lacZ*) gene was inserted into the HVT *EcoRI* # 7 fragment at the unique *StuI* site. The marker gene is oriented in the same direction as the US2 gene. A detailed description of the marker gene is given in Figures 7A and 7B. It is constructed utilizing standard recombinant DNA techniques (Maniatis et al, 1982 and Sambrook et al, 1989), by joining restriction fragments from the following sources with the synthetic DNA sequences indicated in Figures 7A and 7B. Fragment 1 is an approximately 413 base pair *SalI* to *BamHI* restriction sub-fragment of the PRV *BamHI* restriction fragment 10 (Lomniczi et al., 1984). Fragment 2 is an approximately 3010 base pair *BamHI* to *PvuII* restriction fragment of plasmid pJF751 (Ferrari et al., 1985). Fragment 3 is an approximately 754 base pair *NdeI* to

SallI restriction sub-fragment of the PRV BamHI restriction fragment #7 (Lomniczi et al., 1984).

**RNA ISOLATED FROM CONCANAVALIN A STIMULATED CHICKEN**

5 **SPLEEN CELLS:** Chicken spleens were dissected from 3 week old chicks from SPAFAS, Inc., washed, and disrupted through a syringe/needle to release cells. After allowing stroma and debris to settle out, the cells were pelleted and washed twice with PBS. The cell pellet was treated with a hypotonic lysis buffer to lyse red blood cells, and splenocytes were recovered and washed twice with PBS. Splenocytes were resuspended at  $5 \times 10^6$  cells/ml in RPMI containing 5% FBS and 5  $\mu$ g/ml Concanavalin A and incubated at 39° for 48 hours. 10 Total RNA was isolated from the cells using guanidine isothionate lysis reagents and protocols from the Promega RNA isolation kit (Promega Corporation, Madison WI). 4  $\mu$ g of total RNA was used in each 1st strand reaction containing the appropriate antisense primers and AMV reverse transcriptase (Promega Corporation, Madison WI). cDNA synthesis was performed in the same tube following the reverse transcriptase reaction, using the appropriate sense primers and Vent® DNA polymerase (Life Technologies, Inc. Bethesda, MD).

25 **SUBGENOMIC CLONE 172-07.BA2.** Plasmid 172-07.BA2 was constructed for the purpose of generating recombinant HVT. It contains an approximately 25,000 base pair region of genomic HVT DNA. It may be used in conjunction with other subgenomic clones according to the PROCEDURE FOR GENERATING RECOMBINANT HERPESVIRUS FROM OVERLAPPING SUBGENOMIC FRAGMENTS for the construction of recombinant HVT. This plasmid may be constructed utilizing standard recombinant DNA techniques (Maniatis et al, 1982 and Sambrook et al, 35 1989), by joining two restriction fragments from the following sources. The first fragment is an

approximately 2999 base pair *Bam*HI to *Bam*HI restriction fragment of pSP64 (Promega). The second fragment is the approximately 25,000 base pair *Bam*HI #2 fragment of HVT (Buckmaster et al., 1988).

5

HOMOLOGY VECTOR 172-29.31. The plasmid 172-29.31 was constructed for the purpose of inserting foreign DNA into HVT. It contains a unique *Xho*I restriction enzyme site into which foreign DNA may be inserted. When a plasmid containing a foreign DNA insert at the *Xho*I site is used according to the DNA COTRANSFECTION FOR GENERATING RECOMBINANT HERPESVIRUSES or the PROCEDURE FOR GENERATING RECOMBINANT HERPESVIRUS FROM OVERLAPPING SUBGENOMIC FRAGMENTS a virus containing the foreign DNA will result. This plasmid may be constructed utilizing standard recombinant DNA techniques (Maniatis et al, 1982 and Sambrook et al, 1989), by joining two restriction fragments from the following sources. The first fragment is an approximately 2999 base pair *Bam*HI to *Bam*HI restriction fragment of pSP64 (Promega). The second fragment is the approximately 3300 base pair *Bam*HI #16 fragment of HVT (Buckmaster et al., 1988). The complete sequence of the *Bam*HI #16 fragment is given in SEQ ID NO:3. Note that the fragment was cloned such that the UL43 ORF is in the opposite transcriptional orientation to the pSP64  $\beta$ -lactamase gene.

25

HOMOLOGY VECTOR 172-63.1. The plasmid 172-63.1 was constructed for the purpose of inserting foreign DNA into HVT. It contains a unique *Xho*I restriction enzyme site into which foreign DNA may be inserted. When a plasmid containing a foreign DNA insert at the *Xho*I site is used according to the DNA COTRANSFECTION FOR GENERATING RECOMBINANT HERPESVIRUSES or the PROCEDURE FOR GENERATING RECOMBINANT HERPESVIRUS FROM OVERLAPPING SUBGENOMIC FRAGMENTS a virus containing the foreign DNA

30

35

will result. This plasmid may be constructed utilizing standard recombinant DNA techniques (Maniatis et al, 1982 and Sambrook et al, 1989), by joining two restriction fragments from the following sources. The first fragment is an approximately 2999 base pair *EcoRI* to *EcoRI* restriction fragment of pSP64 (Promega). The second fragment is the approximately 5500 base pair *EcoRI* #9 fragment of HVT. Note that the *EcoRI* fragment was cloned such that the unique *XhoI* site is closest to the unique *HindIII* site in the pSP64 vector.

**HOMOLOGY VECTORS 255-18.B16.** The plasmid 255-18.B16 was constructed for the purpose of inserting the NDV HN and F genes into HVT. The NDV HN and F genes were inserted as a *SalI* fragment into the homology vector 172-29.31 at the *XhoI* site. The NDV HN and F genes were inserted in the same transcriptional orientation the UL43 ORF in the parental homology vector. A detailed description of the *SalI* fragment is shown in Figures 12A-12C. The inserted *SalI* fragment may be constructed utilizing standard recombinant DNA techniques (Maniatis et al, 1982 and Sambrook et al, 1989), by joining restriction fragments from the following sources with the synthetic DNA sequences indicated in Figures 12A, 12B and 12C. Fragment 1 is an approximately 416 base pair *SalI* to *BamHI* restriction sub-fragment of the PRV *BamHI* restriction fragment 10 (Lomniczi et al., 1984). Fragment 2 is an approximately 3009 base pair *BamHI* to *PvuII* fragment of the plasmid pJF751 (Ferrari et al., 1985). Fragment 3 is an approximately 1200 base pair *AvaII* to *EcoRI* restriction fragment of full length NDV HN cDNA. Fragment 4 is an approximately 179 base pair *EcoRI* to *PvuII* restriction fragment of the plasmid pSP64 (Promega). Fragment 5 is an approximately 357 base pair *SmaI* to *BamHI* restriction sub-fragment of the HSV-1 *BamHI* restriction fragment N. Fragment 6 is an

approximately 1812 base pair *Bam*HI to *Pst*I restriction fragment of the full length NDV F cDNA. Fragment 7 is an approximately 235 base pair *Pst*I to *Sca*I restriction fragment of the plasmid pBR322.

5

SUBGENOMIC CLONE 378-50.BA1. Cosmid 378-50.BA1 was constructed for the purpose of generating recombinant HVT. It contains an approximately 29,500 base pair region of genomic HVT DNA. It may be used in conjunction with other subgenomic clones according to the PROCEDURE FOR GENERATING RECOMBINANT HERPESVIRUS FROM OVERLAPPING SUBGENOMIC FRAGMENTS for the construction of recombinant HVT. This cosmid may be constructed by joining two restriction fragments from the following sources. The first fragment is an approximately 8164 base pair *Bam*HI to *Bam*HI restriction fragment of pWE15 (Stratagene). The second fragment is the approximately 29,500 base pair *Bam*HI #1 fragment of HVT (Buckmaster et al., 1988).

20

SUBGENOMIC CLONE 407-32.1C1. Cosmid 407-32.1C1 was constructed for the purpose of generating recombinant HVT. It contains an approximately 38,850 base pair region of genomic HVT DNA (see Figure 8). This region includes *Bam*HI fragments 11, 7, 8, 21, 6, 18, approximately 1250 base pairs of fragment 13, and approximately 6,700 base pairs of fragment 1. It may be used in conjunction with other subgenomic clones according to the PROCEDURE FOR GENERATING RECOMBINANT HERPESVIRUS FROM OVERLAPPING SUBGENOMIC FRAGMENTS for the construction of recombinant HVT. This cosmid may be constructed as described above in the PROCEDURE FOR GENERATING RECOMBINANT HERPESVIRUS FROM OVERLAPPING SUBGENOMIC FRAGMENTS. It was isolated from the sheared DNA library by screening with the probes P1 and P4 (described in Figure 8). A bacterial strain containing this cosmid has been deposited on March 3, 1993

35

pursuant to the Budapest Treaty on the International Deposit of Microorganisms for the Purposes of Patent Procedure with the Patent Culture Depository of the American Type Culture Collection, 12301 Parklawn Drive, Rockville, Maryland 20852 U.S.A. under ATCC Accession No. 75428.

**SUBGENOMIC CLONE 407-32.2C3.** Cosmid 407-32.2C3 was constructed for the purpose of generating recombinant HVT. It contains an approximately 40,170 base pair region of genomic HVT DNA (see Figure 8). This region includes *Bam*HI fragments 10, 14, 19, 17, 5, and approximately 2,100 base pairs of fragment 2. It may be used in conjunction with other subgenomic clones according to the PROCEDURE FOR GENERATING RECOMBINANT HERPESVIRUS FROM OVERLAPPING SUBGENOMIC FRAGMENTS for the construction of recombinant HVT. This cosmid may be constructed as described above in the PROCEDURE FOR GENERATING RECOMBINANT HERPESVIRUS FROM OVERLAPPING SUBGENOMIC FRAGMENTS. It was isolated from the sheared DNA library by screening with the probes P1 and P2 (described in Figure 8). A bacterial strain containing this cosmid has been deposited pursuant to the Budapest Treaty on the International Deposit of Microorganisms for the Purposes of Patent Procedure with the Patent Culture Depository of the American Type Culture Collection, 12301 Parklawn Drive, Rockville, Maryland 20852 U.S.A. under ATCC Accession No. 75430.

**SUBGENOMIC CLONE 407-32.5G6.** Cosmid 407-32.5G6 was constructed for the purpose of generating recombinant HVT. It contains an approximately 40,000 base pair region of genomic HVT DNA (see Figure 8). This region includes *Bam*HI fragments 9, 3, 20, 12, 16, 13, approximately 1,650 base pairs of fragment 2, and approximately 4,000 base pairs of fragment 11. It may be used in conjunction with other subgenomic clones

according to the PROCEDURE FOR GENERATING RECOMBINANT  
HERPESVIRUS FROM OVERLAPPING SUBGENOMIC FRAGMENTS for  
the construction of recombinant HVT. This cosmid may be  
constructed as described above in the PROCEDURE FOR  
5 GENERATING RECOMBINANT HERPESVIRUS FROM OVERLAPPING  
SUBGENOMIC FRAGMENTS. It was isolated from the sheared  
DNA library by screening with the probes P2 and P3  
(described in Figure 8). A bacterial strain containing  
this cosmid has been deposited on March 3, 1993  
10 pursuant to the Budapest Treaty on the International  
Deposit of Microorganisms for the Purposes of Patent  
Procedure with the Patent Culture Depository of the  
American Type Culture Collection, 12301 Parklawn Drive,  
Rockville, Maryland 20852 U.S.A. under ATCC Accession  
15 No. 75427.

HOMOLOGY VECTOR 435-47.1. The plasmid 435-47.1 was  
constructed for the purpose of inserting foreign DNA  
into HVT. It contains a unique *Hind*III restriction  
20 enzyme site into which foreign DNA may be inserted.  
When a plasmid containing a foreign DNA insert at the  
*Hind*III site is used according to the DNA  
COTRANSFECTION FOR GENERATING RECOMBINANT HERPESVIRUSES  
or the PROCEDURE FOR GENERATING RECOMBINANT HERPESVIRUS  
25 FROM OVERLAPPING SUBGENOMIC FRAGMENTS a virus  
containing the foreign DNA will result. This plasmid  
may be constructed utilizing standard recombinant DNA  
techniques (Maniatis et al, 1982 and Sambrook et al,  
1989), by joining two restriction fragments from the  
30 following sources. The first fragment is an  
approximately 2999 base pair *Eco*RI to *Eco*RI restriction  
fragment of pSP64 (Promega). The second fragment is  
the approximately 7300 base pair *Eco*RI #7 fragment of  
HVT. Note that the *Hind*III site of the pSP64 vector was  
35 removed by digesting the subclone with *Hind*III followed  
by a Klenow fill in reaction and religation. A  
synthetic *Hind*III linker (CAAGCTTG) was then inserted

into the unique *Stu*I site of the *Eco*RI #7 fragment.

**SUBGENOMIC CLONE 437-26.24.** Plasmid 437-26.24 was constructed for the purpose of generating recombinant HVT. It contains an approximately 13,600 base pair region of genomic HVT DNA. It may be used in conjunction with other subgenomic clones according to the PROCEDURE FOR GENERATING RECOMBINANT HERPESVIRUS FROM OVERLAPPING SUBGENOMIC FRAGMENTS for the construction of recombinant HVT. This plasmid may be constructed utilizing standard recombinant DNA techniques (Maniatis et al, 1982 and Sambrook et al, 1989), by joining two restriction fragments from the following sources. The first fragment is an approximately 2970 base pair *Hind*III to *Bam*HI restriction fragment of pSP64 (Promega). The second fragment is the approximately 13,600 base pair *Bam*HI to *Stu*I sub-fragment of the *Bam*HI #2 fragment of HVT (Buckmaster et al., 1988). Note that the *Bam*HI #2 fragment contains five *Stu*I sites, the site utilized in this subcloning was converted to a *Hind*III site as described in the PROCEDURE FOR GENERATING RECOMBINANT HERPESVIRUS FROM OVERLAPPING SUBGENOMIC FRAGMENTS.

**SUBGENOMIC CLONE 437-26.26.** Plasmid 437-26.26 was constructed for the purpose of generating recombinant HVT. It contains an approximately 15,300 base pair region of genomic HVT DNA. It may be used in conjunction with other subgenomic clones according to the PROCEDURE FOR GENERATING RECOMBINANT HERPESVIRUS FROM OVERLAPPING SUBGENOMIC FRAGMENTS for the construction of recombinant HVT. This plasmid may be constructed utilizing standard recombinant DNA techniques (Maniatis et al, 1982 and Sambrook et al, 1989), by joining two restriction fragments from the following sources. The first fragment is an approximately 2970 base pair *Hind*III to *Bam*HI

restriction fragment of pSP64 (Promega). The second fragment is the approximately 15,300 base pair *Bam*HI to *Stu*I sub-fragment of the *Bam*HI #2 fragment of HVT (Buckmaster et al., 1988). Note that the *Bam*HI #2 fragment contains five *Stu*I sites, the site utilized in this subcloning was converted to a *Hind*III site as described in the PROCEDURE FOR GENERATING RECOMBINANT HERPESVIRUS FROM OVERLAPPING SUBGENOMIC FRAGMENTS.

HOMOLOGY VECTORS 456-18.18 and 456-17.22. The plasmids 456-18.18 and 456-17.22 were constructed for the purpose of inserting the MDV gA and gB genes into HVT. The MDV genes were inserted as a cassette into the homology vector 435-47.1 at the unique *Hind*III site. The MDV genes were inserted at the blunt ended *Hind*III site as a blunt ended *Pst*I to *Eco*RI fragment (see Figures 10A and 10B). The *Hind*III and *Eco*RI sites were blunted by the Klenow fill in reaction. The *Pst*I site was blunted by the T4 DNA polymerase reaction. Note that the MDV cassette was inserted in both orientations. Plasmid 456-18.18 contains the MDV genes inserted in the opposite transcriptional orientation to the US2 gene in the parental homology vector. Plasmid 456-17.22 contains the MDV genes inserted in the same transcriptional orientation as the US2 gene in the parental homology vector. A detailed description of the MDV cassette is given in Figures 10A and 10B. It may be constructed utilizing standard recombinant DNA techniques (Maniatis et al, 1982 and Sambrook et al, 1989), by joining restriction fragments from the following sources with the synthetic DNA sequences indicated in Figures 10A and 10B. Fragment 1 is an approximately 2178 base pair *Pvu*II to *Eco*RV restriction sub-fragment of the MDV *Eco*RI 6.9 KB genomic restriction fragment (Ihara et al., 1989). Fragment 2 is an approximately 3898 base pair *Sal*I to *Eco*RI genomic MDV fragment (Ross, et al., 1989).

HOMOLOGY VECTOR 528-03.37. The plasmid 528-03.37 was constructed for the purpose of inserting the infectious laryngotracheitis (ILT) virus gD gene into HVT. The gD gene followed by the PRV gX poly adenylation signal was inserted as a cassette into the homology vector 435-47.1 at the unique *HindIII* site. The cassette may be constructed utilizing standard recombinant DNA techniques (Maniatis et al, 1982 and Sambrook et al, 1989), by joining restriction fragments from the following sources. The first fragment is an approximately 2060 base pair *EcoRI* to *BclI* restriction sub-fragment of the ILT *KpnI* genomic restriction fragment #8 (10.6 KB). The second fragment is an approximately 754 base pair *NdeI* to *SalI* restriction sub-fragment of the PRV *BamHI* restriction fragment #7 (Lomniczi et al., 1984). Note that the fragments are oriented such that *BclI* and *NdeI* sites are contiguous.

HOMOLOGY VECTOR 528-11.43. The plasmid 528-11.43 was constructed for the purpose of inserting the infectious laryngotracheitis (ILT) virus gB gene (A.M. Griffin, 1991) into HVT. The gB gene was inserted as an *EcoRI* fragment into the homology vector 435-47.1 at the unique *HindIII* site. The gB gene was inserted at the blunt ended *HindIII* site as a blunt ended *EcoRI* fragment. The *HindIII* and *EcoRI* sites were blunted by the Klenow fill in reaction. The gB gene was inserted in the same transcriptional orientation as the US2 gene in the parental homology vector. The *EcoRI* fragment may be obtained as a 3.0 KB ILT virus genomic fragment.

HOMOLOGY VECTOR 518-46.B3. The plasmid 518-46.B3 was constructed for the purpose of inserting foreign DNA into HVT. It contains a unique *HindIII* restriction enzyme site into which foreign DNA may be inserted. When a plasmid containing a foreign DNA insert at the

*Hind*III site is used according to the DNA COTRANSFECTION FOR GENERATING RECOMBINANT HERPESVIRUSES or the PROCEDURE FOR GENERATING RECOMBINANT HERPESVIRUS FROM OVERLAPPING SUBGENOMIC FRAGMENTS a virus containing the foreign DNA will result. This plasmid may be constructed utilizing standard recombinant DNA techniques (Maniatis et al, 1982 and Sambrook et al, 1989), by joining three restriction fragments from the following sources. The first fragment is an approximately 1649 base pair *Pvu*I to *Sal*I restriction fragment of pSP64 (Promega). The second fragment is an approximately 1368 base pair *Pvu*I to *Sal*I restriction fragment of pSP65 (Promega). The third fragment is the approximately 3400 base pair *Xho*I to *Xho*I fragment of plasmid 437-47.1.

**HOMOLOGY VECTOR 535-70.3.** The plasmid 535-70.3 was constructed for the purpose of inserting the MDV gB, and gA genes and the NDV F gene into HVT. The F gene was inserted as a cassette into homology vector 456-17.22 at the *Hind*III site located between the MDV gA and gB genes (see Junction B, Figure 10A). The F gene is under the control of the HCMV immediate early promoter and followed by the HSV-1 TK polyadenylation signal. The F gene was inserted in the same transcriptional orientation as the US2 gene in the parental homology vector. The cassette may be constructed utilizing standard recombinant DNA techniques (Maniatis et al, 1982 and Sambrook et al, 1989), by joining restriction fragments from the following sources. The first fragment is an approximately 1191 base pair *Pst*I to *Ava*II restriction sub-fragment of the HCMV genomic *Xba*I E fragment (D.R. Thomsen, et al., 1981). The second fragment is an approximately 1812 base pair *Bam*HI to *Pst*I restriction fragment of the full length NDV F cDNA clone (B1 strain). The last fragment is an approximately 784 base

pair *Sma*I to *Sma*I restriction sub-fragment of the HSV-1 *Bam*HI restriction fragment Q (McGeoch, et al., 1985).

5        **HOMOLOGY VECTOR 549-24.15.** The plasmid 549-24.15 was constructed for the purpose of inserting the MDV gB, and gA genes and the NDV HN and F genes into HVT. The HN and F genes were inserted as a cassette into homolgy vector 456-17.22 at the *Hind*III site located between the MDV gA and gB genes (see Junction B, Figure 10A). The HN and F genes are under the control of the PRV gpX and HCMV immediate early promoters respectively. The HN and F genes are followed by the PRV gX poly and HSV-1 TK adenylation signals respectively. The cassette may be constructed utilizing standard recombinant DNA techniques (Maniatis et al, 15 1982 and Sambrook et al, 1989), by joining restriction fragments from the following sources. The first fragment is an approximately 413 base pair *Sal*I to *Bam*HI restriction sub-fragment of the PRV *Bam*HI fragment #10 (Lomniczi, et al., 1984) The second fragment is an approximately 1811 base pair *Ava*II to *Nae*I restriction fragment of the full length NDV HN cDNA clone (B1 strain). The third fragment is an approximately 754 base pair *Nde*I to *Sal*I restriction sub-fragment of the PRV *Bam*HI restriction fragment #7 20 (Lomniczi, et al., 1984). The fourth fragment is an approximately 1191 base pair *Pst*I to *Ava*II restriction sub-fragment of the HCMV genomic *Xba*I E fragment (D.R. Thomsen, et al., 1981). The fifth fragment is an approximately 1812 base pair *Bam*HI to *Pst*I restriction fragment of the full length NDV F cDNA clone (B1 strain). The last fragment is an approximately 784 base pair *Sma*I to *Sma*I restriction sub-fragment of the HSV-1 *Bam*HI restriction fragment Q (McGeoch, et al., 1985).

35

**HOMOLOGY VECTOR 549-62.10.** The plasmid 549-62.10 was constructed for the purpose of inserting the MDV gB,

and gA genes and the NDV HN gene into HVT. The HN gene was inserted as a cassette into homolgy vector 456-17.22 at the *HindIII* site located between the MDV gA and gB genes (see Junction B, Figure 10A). The HN gene is under the control of the PRV gpX promoter and followed by the PRV gX poly adenylation signal. The HN gene was inserted in the same transcriptional orientation as the US2 gene in the parental homology vector. The cassette may be constructed utilizing standard recombinant DNA techniques (Maniatis et al, 1982 and Sambrook et al, 1989), by joining restriction fragments from the following sources. The first fragment is an approximately 413 base pair *SalI* to *BamHI* restriction sub-fragment of the PRV *BamHI* fragment #10 (Lomniczi, et al., 1984) The second fragment is an approximately 1811 base pair *AvaII*. to *NaeI* restriction fragment of the full length NDV HN cDNA clone (B1 strain). The last fragment is an approximately 754 base pair *NdeI* to *SalI* restriction sub-fragment of the PRV *BamHI* restriction fragment #7 (Lomniczi, et al., 1984).

**SUBGENOMIC CLONE 550-60.6.** Plasmid 550-60.6 was constructed for the purpose of generating recombinant HVT. It contains an approximately 12,300 base pair region of genomic HVT DNA. It may be used in conjunction with other subgenomic clones according to the PROCEDURE FOR GENERATING RECOMBINANT HERPESVIRUS FROM OVERLAPPING SUBGENOMIC FRAGMENTS for the construction of recombinant HVT. This plasmid may be constructed utilizing standard recombinant DNA techniques (Maniatis et al, 1982 and Sambrook et al, 1989), by joining two restriction fragments from the following sources. The first fragment is an approximately 4176 base pair *EcoRV* to *BamHI* restriction fragment of pBR322. The second fragment is the approximately 12,300 base pair sub-fragment of the

*Bam*HI #2 fragment of HVT (Buckmaster et al., 1988). This fragment was generated in the following manner. Plasmid 437-26.26 was linearized with *Hind*III and then resected with the *Exo*III Mung Bean Deletion Kit (Stratagene). Samples from the 3 and 4 minute reactions were combined and digested with *Bam*HI resulting in a population of fragments containing the desired 12,300 base pair sub-fragment. This population was cloned into the pBR322 fragment and the resulting clones were screened for the appropriate size and restriction map. Fortuitously the resected sub-fragment that generated clone 550-60.6 ended in the nucleotides GG which generated a second *Bam*HI site when ligated to the *Eco*RV site (ATCC) of pBR322. A bacterial strain containing this plasmid has been deposited on March 3, 1993 pursuant to the Budapest Treaty on the International Deposit of Microorganisms for the Purposes of Patent Procedure with the Patent Culture Depository of the American Type Culture Collection, 12301 Parklawn Drive, Rockville, Maryland 20852 U.S.A. under ATCC Accession No. 75429.

**HOMOLOGY VECTORS 566-41.5.** The plasmid 566-41.5 was constructed for the purpose of inserting the MDV gA, gB and gD genes into HVT. The MDV gD gene was inserted as a *Hind*III fragment into the homology vector 456-17.22 at the *Hind*III site located between MDV gA and gB (see Figures 10A and 10B). The MDV gene was inserted in the same transcriptional orientation as gA and gB in the parental homology vector. A detailed description of the *Hind*III fragment containing the MDV gD gene is shown in Figures 11A and 11B. Note that a herpesvirus polyadenation signal was added to the gD gene cassette. The inserted *Hind*III fragment may be constructed utilizing standard recombinant DNA techniques (Maniatis et al, 1982 and Sambrook et al, 1989), by joining restriction fragments from the following sources with

the synthetic DNA sequences indicated in Figures 11A and 11B. Fragment 1 is an approximately 784 base pair *Sma*I to *Sma*I restriction sub-fragment of the HSV-1 *Bam*HI restriction fragment Q (McGeoch et al., 1988).  
5 Note that this fragment is oriented such that the polyadenylation sequence (AATAAA) is located closest to junction B. Fragment 2 is an approximately 2177 base pair *Sal*I to *Nco*I sub-fragment of the MDV *Bgl*II 4.2 KB genomic restriction fragment (Ross, et al., 1991).

10  
HOMOLOGY VECTOR 567-72.1D. The plasmid 567-72.1D was constructed for the purpose of inserting the MDV gB, gA, and gD genes and the infectious bronchitis virus (IBV) matrix and spike genes into HVT. The IBV genes  
15 were inserted as a cassette into homolgy vector 566-41.5 at the unique *Not*I site located upstream of the MDV gD gene (see Junction C, Figure 11B). The IBV spike and matrix genes are under the control of the HCMV immediate early and PRV gpX promoters  
20 respectively. The IBV spike and matrix genes are followed by the HSV-1 TK and PRV gX poly adenylation signals respectively. The IBV genes were inserted in the same transcriptional orientation as the US2 gene in the parental homology vector. The cassette may be  
25 constructed utilizing standard recombinant DNA techniques (Maniatis et al, 1982 and Sambrook et al, 1989), by joining restriction fragments from the following sources. The first fragment is an approximately 413 base pair *Sal*I to *Bam*HI restriction  
30 sub-fragment of the PRV *Bam*HI fragment #10 (Lomniczi, et al., 1984) The second fragment contains amino acids 1 to 223 of the IBV matrix gene. The coding region was obtained from a cDNA clone of the Arkansas strain of IBV. The third fragment is an approximately 754 base  
35 pair *Nde*I to *Sal*I restriction sub-fragment of the PRV *Bam*HI restriction fragment #7 (Lomniczi, et al., 1984). The fourth fragment is an approximately 1191 base pair

*Pst*I to *Ava*II restriction sub-fragment of the HCMV genomic *Xba*I E fragment (D.R. Thomsen, et al., 1981). The fifth fragment contains amino acids 4 to 1162 of the IBV spike gene. The coding region was obtained from a cDNA clone of the Arkansas strain of IBV. The last fragment is an approximately 784 base pair *Sma*I to *Sma*I restriction sub-fragment of the HSV-1 *Bam*HI restriction fragment Q (McGeoch, et al., 1985).

10 HOMOLOGY VECTOR 603-57.F1. The plasmid 603-57.F1 was constructed for the purpose of inserting the IBDV VP2 gene into HVT. The IBDV VP2 gene was inserted as a cassette into homolgy vector 435-47.1 at the unique *Hind*III site. The VP2 gene is under the control of the HCMV immediate early promoter and is followed by the HSV-1 TK poly adenylation signal. The VP2 gene was inserted in the same transcriptional orientation as the US2 in the parental homology vector. The cassette may be constructed utilizing standard recombinant DNA techniques (Maniatis et al, 1982 and Sambrook et al, 1989), by joining restriction fragments from the following sources. The first fragment is an approximately 1191 base pair *Pst*I to *Ava*II restriction sub-fragment of the HCMV genomic *Xba*I E fragment (D.R. Thomsen, et al., 1981). The second fragment is an approximately 1081 base pair *Bcl*I to *Bam*HI restriction sub-fragment of the full length IBDV cDNA clone (see SEQ ID NO:1). Note that the *Bcl*I site was introduced into the cDNA clone directly upstream of the VP2 initiator methionine by converting the sequence CGCAGC to TGATCA. The first and second fragments are oriented such that *Ava*II and *Bcl*I sites are contiguous. The third fragment is an approximately 784 base pair *Sma*I to *Sma*I restriction sub-fragment of the HSV-1 *Bam*HI restriction fragment Q (McGeoch, et al., 1985).

HOMOLOGY VECTOR 633-13.27. The plasmid 633-13.27 was

constructed for the purpose of inserting the MDV gB, gA and gD genes and the NDV HN and F genes into HVT. The HN and F genes are under the control of the PRV gpX and HCMV immediate early promoters respectively. The HN and F genes are followed by the PRV gX poly and HSV-1 TK adenylation signals respectively. All five genes were inserted in the same transcriptional orientation as the US2 gene in the parental homology vector. The genes were inserted in the following order MDV gA, NDV HN, NDV F, MDV gD, and MDV gB.

**HOMOLOGY VECTOR 634-29.16.** The plasmid 634-29.16 was constructed for the purpose of inserting the ILT virus gB and gD genes into HVT. The *lacZ* marker gene followed by the ILT gB and gD genes inserted as a cassette into the homology vector 172-29.31 at the unique *XhoI* site. The cassette may be constructed utilizing standard recombinant DNA techniques (Maniatis et al, 1982 and Sambrook et al, 1989), by joining restriction fragments from the following sources. The first fragment is an approximately 4229 base pair *SalI* to *SalI* restriction fragment derived from the *lacZ* marker gene described above and shown in Figures 7A and 7B. The second fragment is an approximately 2060 base pair *EcoRI* to *BclI* restriction sub-fragment of the ILT *KpnI* genomic restriction fragment #8 (10.6 KB). The third fragment is an approximately 754 base pair *NdeI* to *SalI* restriction sub-fragment of the PRV *BamHI* restriction fragment #7 (Lomniczi et al., 1984). Note that the second and third fragments are oriented such that *BclI* and *NdeI* sites are contiguous. The fourth fragment is the 3.0 KB ILT virus genomic *EcoRI* fragment containing the gB gene. All three genes are in the same transcriptional orientation as the UL43 gene.

**SUBGENOMIC CLONE 415-09.BA1.** Cosmid 415-09.BA1 was constructed for the purpose of generating recombinant

HVT. It contains an approximately 29,500 base pair *Bam*HI #1 fragment of genomic HVT DNA. It was used in conjunction with other subgenomic clones according to the PROCEDURE FOR GENERATING RECOMBINANT HERPESVIRUS FROM OVERLAPPING SUBGENOMIC FRAGMENTS for the construction of recombinant HVT. This cosmid was constructed by joining two restriction fragments (Sambrook, et al., 1989) from the following sources. The vector is an approximately 4430 base pair *Bam*HI to *Bam*HI restriction fragment of pSY1005 derived from pH79 (Bethesda Research Labs, Inc.) and pWE15 (Stratagene, Inc.). The first fragment is the approximately 29,500 base pair *Bam*HI #1 fragment of the HVT genome (Buckmaster et al., 1988).

SUBGENOMIC CLONE 672-01.A40. Cosmid 672-01.A40 was constructed for the purpose of generating recombinant HVT. It was isolated as a subclone of cosmid 407-32.1C1 (see Figures 8 and 15). Cosmid 672-01.A40 contains an approximately 14,000 base pair *Not*I to *Asc*I subfragment and an approximately 1300 base pair *Asc*I to *Bam*HI subfragment of cosmid 407-32.1C1. The cosmid was constructed by joining restriction fragments (Sambrook, et al., 1989) from the following sources. The vector is an approximately 2700 base pair *Not*I to *Bam*HI fragment constructed from pNEB193 (New England Biolabs, Inc.) which contains a *Not*I linker inserted into the *Sma*I site. Fragment 1 is an approximately 15,300 base pair region of genomic HVT DNA. This region includes *Bam*HI fragments 11 and 7, and approximately 1250 base pairs of fragment 13. It was used in conjunction with other subgenomic clones according to the PROCEDURE FOR GENERATING RECOMBINANT HERPESVIRUS FROM OVERLAPPING SUBGENOMIC FRAGMENTS for the construction of recombinant HVT.

SUBGENOMIC CLONE 654-45.1. Plasmid 654-45.1 was

constructed for the purpose of generating recombinant HVT. It was isolated as an AscI subclone of cosmid 407-32.1C1 (see Figures 8 and 15). The cosmid was constructed by joining restriction fragments (Sambrook, et al., 1989) from the following sources. The vector is an approximately 2000 base pair AscI fragment constructed from a 2000 base pair AatII to PvuII fragment of pNEB 193 (New England Biolabs, Inc.) blunt ended with Klenow DNA polymerase and AscI linkers inserted. Fragment 1 is an approximately 8600 base pair AscI to AscI fragment of genomic HVT DNA. This region includes BamHI fragments 10 and 21, and approximately 1100 base pairs of fragment 6 and approximately 1300 base pairs of fragment 7. The XhoI site (Nucleotide #1339-1344; SEQ ID NO. 48) has been converted to a unique PacI site using synthetic DNA linkers. The PacI site was used in insertion and expression of foreign genes in HVT. (See Figure 13A). It was used in conjunction with other subgenomic clones according to the PROCEDURE FOR GENERATING RECOMBINANT HERPESVIRUS FROM OVERLAPPING SUBGENOMIC FRAGMENTS for the construction of recombinant HVT.

**SUBGENOMIC CLONE 686-63.A1.** Plasmid 686-63.A1 was constructed for the purpose of generating recombinant HVT. It was isolated as an AscI subclone of cosmid 407-32.1C1 (see Figure 8, 15). The cosmid was constructed by joining restriction fragments (Sambrook, et al., 1989) from the following sources. The vector is an approximately 2000 base pair AscI fragment constructed from a 2000 base pair AatII to PvuII fragment of pNEB193 (New England Biolabs, Inc.) blunt ended with Klenow DNA polymerase and AscI linkers inserted. Fragment 1 is an approximately 8600 base pair AscI to AscI fragment of genomic HVT DNA. This region includes BamHI fragments 10 and 21, and approximately 1100 base pairs of fragment 6 and

approximately 1300 base pairs of fragment 7. The *Xho*I site (Nucleotide #1339-1344; SEQ ID NO. 48) has been converted to a unique *Not*I site using synthetic DNA linkers. The *Not*I site was used for the insertion and expression of foreign genes in HVT. (See Figure 13B). It was used in conjunction with other subgenomic clones according to the PROCEDURE FOR GENERATING RECOMBINANT HERPESVIRUS FROM OVERLAPPING SUBGENOMIC FRAGMENTS for the construction of recombinant HVT.

**SUBGENOMIC CLONE 672-07.C40.** Cosmid 672-07.C40 was constructed for the purpose of generating recombinant HVT. It was isolated as a subclone of cosmid 407-32.1C1 (see Figures 8 and 15). Cosmid 672-07.C40 contains an approximately 1100 base pair *Bam*HI to *Asc*I subfragment and an approximately 13,000 base pair *Asc*I to *Not*I subfragment of cosmid 407-32.1C1. The cosmid was constructed by joining restriction fragments (Sambrook, et al., 1989) from the following sources. The vector is an approximately 2700 base pair *Not*I to *Bam*HI fragment constructed from pNEB193 (New England Biolabs, Inc.) which contains a *Not*I linker inserted into the *Sma*I site. Fragment 1 is an approximately 14,100 base pair region of genomic HVT DNA. This region includes *Bam*HI fragments 6 and 18, and an approximately 2600 base pair *Bam*HI to *Not*I fragment within *Bam*HI fragment #1. It was used in conjunction with other subgenomic clones according to the PROCEDURE FOR GENERATING RECOMBINANT HERPESVIRUS FROM OVERLAPPING SUBGENOMIC FRAGMENTS for the construction of recombinant HVT.

**SUBGENOMIC CLONE 706-57.A3.** Plasmid 706-57.A3 was constructed for the purpose of generating recombinant HVT. Plasmid 706-57.A3 contains the IBDV VP2 gene inserted into the *Pac*I site of plasmid 654-45.1. The IBDV VP2 gene uses the IBRV VP8 promoter and ILTV US3 polyadenylation signal. The cosmid was constructed

utilizing standard recombinant DNA techniques (Sambrook, et al., 1989). The first fragment is a 208 base pair *HindIII* to *BamHI* fragment coding for the IBRV VP8 promoter (Carpenter, et al., 1991)). The second  
5 fragment is an approximately 1626 base pair fragment coding for the IBDV VP2 gene derived by reverse transcription and polymerase chain reaction (Sambrook, et al., 1989) of IBDV standard challenge strain (USDA) genomic RNA (Kibenge, et al., 1990). The antisense  
10 primer used for reverse transcription and PCR was 5'-CTGGTTCGGCCCATGATCAGATGACAAACCTGCAAGATC-3' (SEQ ID NO. 53). The sense primer used for PCR was 5'-CTGGTTCGGCCCATGATCAGATGACAAACCTGCAAGATC-3' (SEQ ID NO. 54). The DNA fragment generated by PCR was cloned into  
15 the PCR-Direct™ vector (Clontech Laboratories, Inc., Pali Alto, CA). The IBDV VP2 fragment was subcloned next to the VP8 promoter using *BclI* sites generated by the PCR primers. The DNA sequence at this junction adds amino acids methionine, aspartate and glutamine  
20 before the antive initiator methionine of VP2. The DNA fragment contains the coding sequence from amino acid 1 to amino acid 536 of the IBDV polyprotein (SEQ ID NO: 2) which includes the entire coding sequence of the VP2 protein. The third fragment is an approximately 494  
25 base pair fragment coding for the ILTV US3 polyadenylation signal.

**SUBGENOMIC CLONE 711-92.1A.** Plasmid 711-92.1A was constructed for the purpose of generating recombinant  
30 HVT. Plasmid 711-92.1A contains the ILTV gD and gI genes inserted into the *PacI* site of plasmid 654-45.1. The ILTV gD and gI genes use their respective endogenous ILTV promoters and single shared endogenous polyadenylation signal. The plasmid was constructed  
35 utilizing standard recombinant DNA techniques (Sambrook, et al., 1989). The first fragment is an approximately 3556 base pair *SalI* to *HindIII*

restriction subfragment of the ILTV Asp718I genomic fragment #8 (10.6 kb).

5        **SUBGENOMIC CLONE 717-38.12.** Plasmid 717-38.12 was constructed for the purpose of generating recombinant HVT. Plasmid 717-38.12 contains the NDV HN and F genes inserted into the *PacI* site of plasmid 654-45.1. The NDV HN gene uses the PRV gX promoter and the PRV gX polyadenylation signal. The NDV F gene uses the HCMV  
10        immediate early promoter and the HSV TK polyadenylation signal. The plasmid was constructed utilizing standard recombinant DNA techniques (Sambrook, et al., 1989). The first fragment is an approximately 413 base pair *Sall* to *BamHI* restriction subfragment of the PRV *BamHI*  
15        fragment #10 (Lomniczi, et al., 1984). The second fragment is an approximately 1811 base pair *AvaII* to *NaeI* restriction fragment of the full length NDV HN cDNA clone (B1 strain). The third fragment is an approximately 754 base pair *NdeI* to *Sall* restriction  
20        subfragment of the PRV *BamHI* restriction fragment #7 (Lomniczi, et al., 1984). The fourth fragment is an approximately 1191 base pair *PstI* to *AvaII* restriction subfragment of the HCMV genomic *XbaI* E fragment (D.R. Thomsen, et al., 1981). The fifth fragment is an  
25        approximately 1812 base pair *BamHI* to *PstI* restriction fragment of the full length NDV F cDNA clone (B1 strain; SEQ ID NO: 12). The sixth fragment is an approximately 784 base pair *SmaI* to *SmaI* restriction subfragment of the HSV-1 *BamHI* restriction fragment Q  
30        (McGeoch, et al., 1985).

**SUBGENOMIC CLONE 721-38.1J.** Cosmid 721-38.1J was constructed for the purpose of inserting the MDV gA, gD, and gB genes into the unique short of HVT and for  
35        the purpose of generating recombinant HVT. Cosmid 721-38.1J contains the MDV gA, gD and gB genes inserted into a *StuI* site in the HVT US2 gene converted to a

unique *Hind*III site within the *Bam*HI #1 fragment of the unique short region of HVT. This region of the HVT *Bam*HI #1 fragment containing the MDV genes was derived from S-HVT-062. Cosmid 721-38.1J was constructed by a partial restriction digest with *Bam*HI of S-HVT-062 DNA and isolation of an approximately 39,300 base pair fragment. The cosmid was constructed utilizing standard recombinant DNA techniques (Sambrook, et al., 1989) by joining restriction fragments from the following sources. The vector is an approximately 8200 base pair *Bam*HI fragment from cosmid vector pWE15. The first fragment is an approximately 900 base pair *Bam*HI fragment from the repeat region of the HVT genome. The second fragment is an approximately 15,500 base pair *Bam*HI to *Stu*I subfragment of *Bam*HI #1 of HVT. The third fragment is an approximately 8400 base pair cassette containing the MDV gA, gD, and gB genes (see figures 10 and 11). The fourth fragment is an approximately 14,500 base pair *Hind*III to *Bam*HI subfragment of the *Bam*HI #1 of HVT.

**SUBGENOMIC CLONE 722-60.E2.** Cosmid 722-60.E2 was constructed for the purpose of inserting the MDV gA, gD, and gB genes and the NDV HN and F genes into the unique short of HVT and for the purpose of generating recombinant HVT. Cosmid 722-60.E2 contains the MDV gA, gD and gB genes and the NDV HN and F genes inserted into a *Stu*I site in the HVT US2 gene converted to a unique *Hind*III site within the *Bam*HI #1 fragment of the unique short region of HVT. All five genes were inserted in the same transcriptional orientation as the HVT US2 gene. This region of the HVT *Bam*HI #1 fragment containing the MDV and NDV genes was derived from S-HVT-106. Cosmid 722-60.E2 was constructed by a partial restriction digest with *Bam*HI of S-HVT-106 and isolation of an approximately 46,300 base pair fragment. The cosmid was constructed utilizing

standard recombinant DNA techniques (Sambrook, et al., 1989) by joining restriction fragments from the following sources. The vector is an approximately 6100 base pair *Bam*HI fragment from cosmid vector pSY1626  
5 derived from pH79 (Bethesda Research Labs, Inc.) and pWE15 (Stratagene, Inc.). The first fragment is an approximately 900 base pair *Bam*HI fragment from the repeat region of the HVT genome. The second fragment is an approximately 15,500 base pair *Bam*HI to *Stu*I  
10 subfragment of *Bam*HI #1 of HVT. The third fragment is an approximately 15,400 base pair cassette containing the MDV gA gene, (Figures 10A and 10B, SEQ ID NO: 8), the PRV gX promoter (Lomniczi et al., 1984), the NDV HN gene (SEQ ID NO: 10), the PRV gX polyadenylation site  
15 (Lomniczi et al., 1984), the HCMV immediate early promoter\* (D.R. Thomsen, et al., 1981), the NDV F gene (SEQ ID NO: 12), the HSV TK polyadenylation site (McGeoch, et al., 1985), the MDV gD gene (Figures 11A and 11B), the approximately 450 base pair ILTV US3  
20 polyadenylation site, and the MDV gB gene (Figures 10A and 10B). The fourth fragment is an approximately 14,500 base pair *Stu*I to *Bam*HI subfragment of the *Bam*HI #1 of HVT.

25 **SUBGENOMIC CLONE 729-37.1.** Plasmid 729-37.1 was constructed for the purpose of generating recombinant HVT. Plasmid 729-37.1 contains the ILTV gD and gB genes inserted into the *Not*I site of plasmid 686-63.A1. The ILTV gD and gB genes use their respective endogenous  
30 ILTV promoters, and the ILTV gD and gB gene are each followed by a PRV gX polyadenylation signals. The ILTV gD and gB gene cassette was constructed utilizing standard recombinant DNA techniques (Sambrook, et al., 1989). The first fragment is an approximately 2052 base  
35 pair *Sal*I to *Xba*I restriction subfragment of the ILTV Asp718I genomic fragment #8 (10.6 kb). The second fragment is an approximately 572 base pair *Xba*I to

Asp718I restriction subfragment of the PRV BamHI restriction fragment #7 (Lomniczi et al., 1984). The third fragment is an approximately 3059 base pair EcoRI to EcoRI restriction fragment of ILTV genomic DNA. The fourth fragment is an approximately 222 base pair EcoRI to SalI restriction subfragment of the PRV BamHI restriction fragment #7 (Lomniczi et al., 1984).

**SUBGENOMIC CLONE 739-27.16.** Cosmid 739-27.16 was constructed for the purpose of constructing achimeric HVT/MDV virus containing the HVT genes of the unique long region and the MDV type 1 genes of the unique short region. Cosmid 739-27.16 contains the complete unique short region of MDV type 1. This region contains the entire SmaI B fragment and two SmaI K fragments. Cosmid 739-27.16 was constructed by a partial restriction digest with SmaI of MDV DNA and isolation of an approximately 29,000 to 33,000 base pair fragment. The cosmid was constructed utilizing standard recombinant DNA techniques (Sambrook, et al., 1989) by joining restriction fragments from the following sources. The vector is an approximately 8200 base pair BamHI fragment (made blunt-ended with Lenov DNA polymerase) from cosmid vector pWE15. The first fragment is an approximately 4050 base pair SmaI K fragment from the short internal repeat region of the MDV genome. The second fragment is an approximately 21,000 base pair fragment SmaI B of MDV. The third fragment is an approximately 3,650 base pair SmaI K fragment from the short terminal repeat region of the MDV genome (Fukuchi, et al., 1984, 1985).

**SUBGENOMIC CLONE 751-87.A8.** Plasmid 751-87.A8 was constructed for the purpose of generating recombinant HVT. Plasmid 751-87.A8 contains the chicken myelomonocytic growth factor (cGMF) gene inserted into the PacI site of plasmid 654-45.1. The cMGF gene uses

the HCMV immediate early promoter and HSV-1 TK polyadenylation signal. The cosmid was constructed utilizing standard recombinant DNA techniques (Sambrook, et al., 1989). The following fragments were inserted into the PacI site of HVT subgenomic clone 654-45.1. The first fragment is an approximately 1191 base pair PstI to AvaII restriction subfragment of the HCMV genomic XbaI E fragment (D.R. Thomsen, et al., 1981). The second fragment is an approximately 640 base pair fragment coding for the cMGF gene (58) derived by reverse transcription and polymerase chain reaction (PCR) (Sambrook, et al., 1989) of RNA ISOLATED FROM CONCAVALIN A STIMULATED CHICKEN SPLEEN CELLS. The antisense primer used for reverse transcription and PCR was 5'-CGCAGGATCCGGGGCGTCAGAGGCGGGCGAGGTG-3' (SEQ ID NO: 57). The sense primer used for PCR was 5'-GAGCGGATCCTGCAGGAGGAGACACAGAGCTG-3' (SEQ ID NO: 58). The cMGF fragment was subcloned next to the HCMV IE promoter using BamHI sites generated by the PCR primers. The DNA fragment contains the coding sequence from amino acid 1 to amino acid 201 of the cMGF protein (58) which includes a 23 amino acid leader sequence at the amino terminus and 178 amino acids of the mature cMGF protein. The third fragment is an approximately 784 base pair SmaI to SmaI restriction subfragment of the HSV-1 BamHI restriction fragment Q (McGeoch, et al., 1985).

**SUBGENOMIC CLONE 761-07.A1.** Plasmid 761-07.A1 was constructed for the purpose of generating recombinant HVT. Plasmid 761-07.A1 contains the chicken interferon gene inserted into the PacI site of plasmid 654-45.1. The chicken interferon gene uses the HCMV immediate early promoter and HSV-1 TK polyadenylation signal. The cosmid was constructed utilizing standard recombinant DNA techniques (Sambrook, et al., 1989). The following fragments were inserted into the PacI site of HVT

subgenomic clone 654-45.1. The first fragment is an approximately 1191 base pair PstI to AvaII restriction subfragment of the HCMV genomic XbaI E fragment (D.R. Thomsen, et al., 1981). The second fragment is an approximately 577 base pair fragment coding for the chicken interferon gene (59) derived by reverse transcription and polymerase chain reaction (PCR) (Sambrook, et al., 1989) of RNA ISOLATED FROM CONCANAVALLIN A STIMULATED CHICKEN SPLEEN CELLS. The antisense primer used for reverse transcription and PCR was 5'-TG TAGAGATCTGGCTAAGTGC GCGTGTTCCTG-3' (SEQ ID NO: 59). The sense primer used for PCR was 5'-TGTACAGATCTCACCATGGCTGTGCCTGCAAGC-3' (SEQ ID NO: 60). The chicken interferon gene fragment was subcloned next to the HCMV IE promoter using BglII sites generated by the PCR primers. The DNA fragment contains the coding sequence from amino acid 1 to amino acid 193 of the chicken interferon protein (59) which includes a 31 amino acid signal sequence at the amino terminus and 162 amino acids of the mature protein encoding chicken interferon. The third fragment is an approximately 784 base pair SmaI to SmaI restriction subfragment of the HSV-1 BamHI restriction fragment Q (McGeoch, et al., 1985).

**EXAMPLE 1**S-HVT-001

5 S-HVT-001 is a herpesvirus of turkeys (HVT) that  
contains the *E. coli*  $\beta$ -galactosidase gene inserted into  
the unique long region of the HVT genome. The  
restriction enzyme map of HVT has been published (T.  
Igarashi, et al., 1985). This information was used as  
10 a starting point to engineer the insertion of foreign  
genes into HVT. The *Bam*HI restriction map of HVT is  
shown in Figure 1A. From this data, several different  
regions of HVT DNA into which insertions of foreign  
genes could be made were targeted. The foreign gene  
15 chosen for insertion was the *E. coli*  $\beta$ -galactosidase  
(*lacZ*) gene, which was used in PRV. The promoter was  
the PRV gpX promoter. The *lacZ* gene was inserted into  
the unique long region of HVT, specifically into the  
*Xho*I site in the *Bam*HI #16 (3329bp) fragment, and was  
20 shown to be expressed in an HVT recombinant by the  
formation of blue plaques using the substrate Bluogal™  
(Bethesda Research Labs). Similarly, the *lacZ* gene has  
been inserted into the *Sal*I site in the repeat region  
contained within the *Bam*HI #19 (900 bp) fragment.

25 These experiments show that HVT is amenable to the  
procedures described within this application for the  
insertion and expression of foreign genes in  
herpesviruses. In particular, two sites for insertion  
30 of foreign DNA have been identified (Figs. 1B and 1C).

EXAMPLE 2S-HVT-003

35 S-HVT-003 is a herpesvirus of turkeys (HVT) that  
contains the *E. coli*  $\beta$ -galactosidase (*lacZ*) gene and

the infectious bursal disease virus (IBDV) strain S40747 large segment of RNA (as a cDNA copy) (SEQ ID NO: 1) inserted into the unique long region of the HVT genome. This IBDV DNA contains one open reading frame that encodes three proteins (5'VP2-VP4-VP3 3') (SEQ ID NO: 2), two of which are antigens to provide protection against IBDV infections of chickens. Expression of the genes for both  $\beta$ -galactosidase and the IBDV polyprotein are under the control of the pseudorabies virus (PRV) gpX gene promoter. S-HVT-003 was made by homologous recombination. S-HVT-003 was deposited on July 21, 1987 pursuant to the Budapest Treaty on the International Deposit of Microorganism for Purposes of Patent Procedure with the Patent Culture Depository of the American Type Culture Collection, 12301 Parklawn Drive, Rockville, Maryland 20852 U.S.A. under ATCC Accession No. VR 2178.

The IBDV genes were cloned by the cDNA CLONING PROCEDURE. Clones representing the genome of IBDV were screened by SOUTHERN BLOTTING OF DNA procedure against blots containing authentic IBDV RNA. Positive clones were then characterized by restriction mapping to identify groups of clones. Two such clones were identified, that together were found to represent the entire coding region of the IBDV large segment of RNA (3.3 kb dsRNA). One cDNA clone (2-84) contained an approximately 2500 base pair fragment representing the first half of the IBDV gene. The second clone (2-40) contained an approximately 2000 base pair fragment representing the distal half of the IBDV gene. Plasmid 2-84/2-40, representing the entire IBDV gene, was constructed by joining clone 2-84 and 2-40 at a unique PvuII site present in the overlapping sequences. The IBDV genome can be obtained from plasmid 2-84/2-40 as an approximately 3400 base pair SmaI to HpaI fragment. Confirmation of the nature of the proteins encoded by

the IBDV gene was obtained by expressing the clone (2-84/2-40) in *E. coli* and detecting VP3 antigen using antiserum made against purified IBDV capsid proteins on Western blots. The cDNA of the IBDV large segment of RNA encoding the IBDV antigens show one open reading frame that will henceforth be referred to as the IBDV gene. The sequence of an Australian IBDV strain has been published which bears close homology to applicants' sequence (Hudson et al, 1986). Comparison of the amino acid differences between the two viruses revealed 29 amino acid changes within the 1012 amino acid coding region. There were only 3 amino acid differences deduced for VP4 and only 8 in VP3. In contrast, VP2 contained 18 amino acid changes, 14 of which were clustered between amino acids 139 to 332.

For insertion into the genome of HVT, the coding region for the IBDV gene was cloned between the PRV gpX promoter and the HSV TK poly-A signal sequence, creating plasmid 191-23. To aid in the identification of HVT recombinants made by homologous recombination containing the IBDV gene, the gpX promoted IBDV fragment from plasmid 191-23 was inserted behind (in tandem to) a lacZ gene controlled by a gpX promoter. The resultant plasmid, 191-47, contains the *E. coli* lacZ gene and the IBDV gene under the control of individual PRV gpX promoters. In constructing plasmid 191-47, various DNA fragments were joined by recombinant DNA techniques using either naturally occurring restriction sites or synthetic linker DNA. Details concerning the construction of these genes contained in plasmid 191-47 can be seen in Figures 2A, 2B, 2C and 2D.

The first segment of DNA (Segment 1, Figure 2A) contains the gpX promoter region including the residues encoding the first seven amino acids of the gpX gene, and was derived from a subclone of the PRV *Bam*HI #10

fragment as an approximately 800 base pair *Sal*I to *Bam*HI fragment. The second segment of DNA (Segment 2, Figure 2A) contains the *E. coli*  $\beta$ -galactosidase coding region from amino acid 10 to amino acid 1024 and was derived from the plasmid pJF751 (obtained from Jim Hoch, Scripps Clinic and Research Foundation) as an approximately 3300 base pair *Bam*HI to *Bal*I fragment followed by an approximately 40 base pair *Ava* I to *Sma* I fragment. The third segment of DNA (Segment 3, Figure 2A) contains the gpX poly A signal sequence and was derived from a subclone of the PRV *Bam*HI #7 fragment as an approximately 700 base pair *Nde*I to *Stu*I fragment. Segment three was joined to segment two by ligating the *Nde*I end which had been filled in according to the POLYMERASE FILL-IN REACTION, to the *Sma*I site. The fourth segment of DNA (Segment 4, Figure 2A) contains the gpX promoter (TATA box and cap site) and was derived from a subclone of the PRV *Bam*HI #10 fragment as an approximately 330 base pair *Nae*I to *Alu*I fragment. Additionally, segment four contains approximately 36 base pairs of HSV TK 5'untranslated leader sequence as a *Pst*I to *Bgl*III fragment in which the *Pst*I site has been joined to the *Alu*I site through the use of a synthetic DNA linker (McKnight and Kingbury, 1982). DNA segments four through six were inserted as a unit into the unique *Kpn* I site of segment three which is located 3' of the gpX poly A signal sequence. The fifth segment of DNA (Segment 5, Figure 2A) contains the entire coding region of the IBDV large segment of RNA (cDNA clone) as an approximately 3400 base pair *Sma*I to *Hpa*I fragment. The *Sma*I site of segment five was fused to the *Bgl*III site of segment four which had been filled in according to the POLYMERASE FILL IN REACTION. Expression of the IBDV gene (5'VP2-VP4-VP3 3') is under the control of the gpX promoter (segment 4), but utilizes its own natural start and stop codons. The sixth segment of DNA

(Segment 6, Figure 2A) contains the HSV TK poly-A signal sequence as an approximately 800 base pair *SmaI* fragment (obtained from Bernard Roizman, Univ. of Chicago). The *HpaI* site of segment five was fused to  
5 the *SmaI* site of segment six through the use of a synthetic DNA linker.

In summary, the construct used to create S-HVT-003 (plasmid 191-47) contains (5' to 3') the PRV promoter,  
10 the gpX TATA box, the gpX cap site, the first seven amino acids of gpX, the *E. coli*  $\beta$ -galactosidase (*lacZ*) gene, the PRV poly-A signal sequence, the PRV gpX promoter, the gpX TATA box, the gpX cap site, a fusion within the gpX untranslated 5' leader to the IBDV gene,  
15 IBDV start codon, a fusion within the IBDV untranslated 3' end to HSV TK untranslated 3' end, and the TK poly-A signal sequence. The cassette containing these genes was engineered such that it was flanked by two *EcoRI* restriction endonuclease sites. As a result, an  
20 approximately 9100 base pair fragment containing both *lacZ* gene and the IBDV gene can be obtained by digestion with *EcoRI*. Henceforth, the 9161 base pair *EcoRI* fragment will be referred to as the IBDV/*lacZ* cassette. The following procedures were used to  
25 construct S-HVT-003 by homologous recombination. The IBDV/*lacZ* cassette was inserted into the unique *XhoI* site present within a subclone of the HVT *BamHI* #16 fragment. To achieve this, the *XhoI* site was first changed to an *EcoRI* site through the use of an *EcoRI*  
30 linker. This site had previously been shown to be nonessential in HVT by the insertion of *lacZ* (S-HVT-001). It was also shown that the flanking homology regions in *BamHI* #16 were efficient in homologous recombination. Shown in Figures 3A and 3B, the genomic  
35 location of the *BamHI* #16 fragment maps within the unique long region of HVT. The *BamHI* #16 fragment is approximately 3329 base pairs in length (SEQ ID NOs:

3, 4, 5, 6, and 7). HVT DNA was prepared by the PREPARATION OF HERPESVIRUS DNA procedure. Cotransfections of HVT DNA and plasmid DNA into primary chick embryo fibroblast (CEF) cells were done according to the DNA TRANSFECTION FOR GENERATING RECOMBINANT HERPESVIRUS. The recombinant virus resulting from the cotransfection stock was purified by three successive rounds of plaque purification using the BLUOGAL SCREEN FOR RECOMBINANT HERPESVIRUS procedure. When 100% of the plaques were blue, the DNA was analyzed for the presence of the IBDV gene by the SOUTHERN BLOTTING OF DNA procedure. Southern blots, probing *EcoRI* digested S-HVT-003 DNA with an IBDV specific nick translated probe (plasmid 2-84/2-40), confirmed the presence of the 9100 base pair *EcoRI* fragment. This result confirmed that S-HVT-003 contained both the *lacZ* gene and the IBDV gene incorporated into its genome. Additional Southern blots, using a probe specific for *BamHI* #16, confirmed that the homologous recombination occurred at the appropriate position in *BamHI* #16 and that no deletions were created. No differences in the growth of S-HVT-003 compared to wild type virus (S-HVT-000) were observed *in vitro*.

Expression of IBDV specific proteins from S-HVT-003 were assayed *in vitro* using the WESTERN BLOTTING PROCEDURE. Cellular lysates were prepared as described in PREPARATION OF HERPESVIRUS CELL LYSATES. Briefly, the proteins contained in the cellular lysates of S-HVT-003 were separated by polyacrylamide gel electrophoresis, transferred to nitrocellulose, and probed with either an antiserum made against denatured purified IBDV capsid proteins or antiserum made against a synthetic peptide corresponding to a predicted immunodominant region of the IBDV 40 kd (VP2) capsid protein. The filters were washed and treated with [<sup>125</sup>I] protein A to detect the position of the bound antibodies.

Figure 4 shows the results obtained using the antiserum made against denatured purified IBDV capsid proteins, which have been shown by the applicants to react primarily with VP3 (32 kd protein). As seen, S-HVT-003 produces a protein which is immunologically indistinguishable from the authentic VP3 protein from intact IBDV virions. Moreover, the polyprotein appears to be processed correctly, producing a VP3 species that comigrates with the authentic VP3 protein. Recent evidence using an Australian IBDV strain indicates that VP4 is involved in the processing of the precursor polyprotein into mature VP2 and VP3 protein species (Jagadish, et al., 1988). Figure 5 shows the results obtained using a rabbit antiserum raised against a synthetic peptide that is homologous to a 14 amino acid region of the IBDV VP2 (40 kd) capsid protein. As seen, S-HVT-003 produces a protein that is immunologically indistinguishable from the authentic viral VP2 protein. In addition, the VP2 protein produced from S-HVT-003 comigrates with the 40 kd species of VP2 isolated from intact IBDV virions. This species represents a major component of infectious (complete) viral particles.

In summary, analysis of the expression of IBDV specific proteins from S-HVT-003 has shown that the polyprotein is processed in CEF cell culture, producing proteins of the appropriate size that react to immunological reagents specific for either VP2 or VP3 proteins on Western blots.

The following set of experiments was carried out in chickens to analyze the *in vivo* expression of the IBDV genes contained within S-HVT-003 as determined by seroconversion data, serum neutralization results, and protection from IBDV challenge.

The first experiment was designed to show the seroconversion of chickens to IBDV upon being vaccinated with S-HVT-003. Eleven 11-week-old chickens, seronegative to HVT and IBDV were obtained from SPAFAS Inc. Six birds were vaccinated subcutaneously in the abdominal region with 0.5 ml of a cellular suspension of CEF cells containing S-HVT-003 (40,000 PFU/ml). Serum samples were obtained every seven days for eight weeks for all birds in this study. On day 28 (4th week), three of these birds received a boost of S-HVT-003, while the other three birds received 0.5 ml of an inactivated IBDV vaccine inoculated subcutaneously in the cervical region. Three additional birds were given only the inactivated vaccine on day 28. Two birds served as contact controls and received no vaccinations. On day 56, all birds were sacrificed and necropsied. Table 1 show the results of the serum neutralization assay against IBDV. No detectable SN activity was observed in the birds given only S-HVT-003. Additionally, only one of the three birds that were given only the inactivated vaccine demonstrated low but detectable SN activity. SN titers were also detected in one of the three birds that received the S-HVT-003 followed by the inactivated IBDV vaccine boost; these titers were at a much higher level than with the inactivated IBDV vaccine alone. These results suggest that S-HVT-003 is priming the chicken for a secondary response against IBDV. In vitro analysis of the serum samples by WESTERN BLOTTING confirmed the seroconversion of the chickens to IBDV upon vaccination with S-HVT-003 both prior to and after boosts administered on day 28.

25	a Commercial							

In the second experiment, twenty five 1-day old SPF chicks were vaccinated with S-HVT-003 (20 with 0.2ml subcutaneously and 5 by bilateral eyedrop). Twenty chicks were kept as controls. On days four and seven postinfection, five vaccinates and two control birds were bled, sacrificed and their spleens removed for virus isolation. Spleen cell suspensions were made by standard method, and  $\sim 1 \times 10^6$  cells in 3 ml of chick embryo fibroblast (CEF) growth media were inoculated directly onto secondary cells. Cultures were incubated for 6-7 days and then scored for cytopathic effects (CPE) as determined by observing cell morphology. The cultures were passed a second time, and again scored for CPE. The results are shown in Table 2. All nonvaccinated control birds remained negative for HVT for both day 4 and 7 spleen cell isolations. Four out of the five birds vaccinated with S-HVT-003 were positive for HVT at day 4 for both the first and second passages. One

bird did not produce virus, this may represent a vaccination failure. Five out of five birds were positive for HVT on day 7 at both passage one and two. Overall, the vector recovery experiment demonstrates that S-HVT-003 replicates as well as wild type HVT virus *in vivo* and that insertion of the IBDV/*lacZ* cassette into the *XhoI* site of *BamHI* #16 does not result in detectable attenuation of virus. Subsequent experiments examining the recovered virus by the BLUOGAL SCREEN FOR RECOMBINANT HERPESVIRUS procedure confirmed the *in vivo* stability of S-HVT-003, by demonstrating  $\beta$ -galactosidase expression in 100% of the viruses.

25 At days 0, 4, 7, 14, 21, and 27 postinfection, blood samples were obtained from the rest of the chickens for determining serum ELISA titers against IBDV and HVT antigens as well as for virus neutralizing tests against IBDV. Additionally, at 21 days postinfection

30 five control and fourteen vaccinated chicks were challenged with virulent IBDV by bi-lateral eyedrop ( $10^{3.8}$ EID<sub>50</sub>). All birds were sacrificed 6-days post challenge and bursa to body weight ratios were calculated. A summary of the results is shown in

35 tables 3 and 4, respectively. As presented in Table 3, no antibodies were detected against HVT antigens by ELISA prior to 21-27 days post vaccination. In chickens, the immune response during the first two weeks post hatch is both immature and parentally

40 suppressed, and therefore these results are not totally unexpected. In contrast, IBDV ELISA's were negative up to day 21 post-vaccination, and were only detectable after challenge on day 27. The ELISA levels seen on

day 27 post-vaccination indicate a primary response to IBDV. Table 4 comparing the Bursa-to-Body weight ratios for challenged controls and vaccinated/challenged groups show no significant differences. Vaccination with S-HVT-003 under these conditions did not prevent infection of the vaccinated birds by IBDV challenge, as indicated by the death of four vaccinated birds following challenge.

35 Values are mean values. Body weights are different in control group because challenged birds did not feed well. Four challenged-treated birds died.

40 A third experiment was conducted repeating Experiment 2 but using immunologically responsive chicks (3 weeks of age). Six three week old SPF leghorn chickens were vaccinated intraperitoneally with 0.2ml of S-HVT-003 (one drop in each eye). Serum samples were obtained every seven days for six-weeks and the birds were

45 challenged with the virulent USDA standard challenge

IBDV virus on day 43 post-vaccination. Six days post challenge, the control, vaccinated-challenged, and challenged groups were sacrificed and bursas were harvested for probing with anti-IBDV monoclonal antibodies (MAB) (provided by Dr. David Snyder, Virginia-Maryland Regional College of Veterinary Medicine). Bursal homogenates were prepared by mixing 1 ml of 0.5% NP40 with one bursa. Bursas were then ground and briefly sonicated. Supernatants from the homogenates were reacted with the R63 MAB which had been affixed to 96-well Elisa plates via a protein A linkage. After incubation, a biotin labeled preparation of the R63 MAB was added. After washing, an avidin-horse radish peroxidase conjugate was added and incubated. Tests were developed with Tris-malate buffer (TMB) + H<sub>2</sub>O<sub>2</sub> substrate. The test results are presented in Table 5. The data show the presence of high levels of IBDV antigen in all bursas in the vaccinated-challenged group and in the challenged group. No IBDV antigen was detected in the controls. IBDV specific antigen could be detected at dilutions of over 1/1000, and there does not appear to be differences between vaccinated and non-vaccinated challenged groups. HVT titers as determined by ELISA were first detectable at day 7 in four out of the six birds vaccinated. By day 14, six out of six vaccinated birds showed titers to HVT. All six birds continued to show HVT titers throughout the experiment. No IBDV SN titers were seen prior to the challenge. In contrast, analysis of these same serum samples by the WESTERN BLOTTING procedure demonstrated the seroconversion of chickens vaccinated with S-HVT-003 to IBDV prior to administration of the virus challenge. The level of response, however, remains small unless boosted by challenge. Comparison between the vaccinated/challenged and challenged only groups clearly demonstrates that the level of reactivity by

Western blots is much higher in the vaccinated/challenged group. These results show that S-HVT-003 is seroconverting vaccinated birds to IBDV, and suggest that the level of IBDV specific expression are not high enough to induce a neutralizing response in the birds.

S-HVT-003 shows the merit of the vaccine approach the applicants have invented. HVT has been engineered to simultaneously express the foreign antigens ( $\beta$ -galactosidase and IBDV antigens) that are recognized in the host by an immune response directed to these proteins.

Example 3S-HVT-004

5 S-HVT-004 is a recombinant herpesvirus of turkeys that contains the Marek's disease virus (MDV) glycoprotein A (gA) gene inserted into the long unique region, and the  $\beta$ -galactosidase (*lacZ*) gene also inserted in the long unique region. The MDV antigen is more likely to  
10 elicit the proper antigenic response than the HVT equivalent antigen.

The MDV gA (SEQ ID NOS: 8 and 9) gene was cloned by standard DNA cloning gA procedures. An *EcoRI*  
15 restriction fragment had been reported to contain the MDV gA gene (Isfort et al., 1984) and this fragment was identified by size in the DNA clones. The region of the DNA reported to contain the gA gene was sequenced by applicants and found to contain a glycoprotein gene  
20 as expected. The DNA from this gene was used to find the corresponding gene in HVT by the SOUTHERN BLOTTING OF DNA procedure, and a gene in HVT was identified that contained a very similar sequence. This gene is the same gene previously called gA (Isfort et al., 1984).

25 For insertion into the genome of HVT, the MDV gA gene was used intact because it would have good herpesvirus signal sequences already. The *lacZ* gene was inserted into the *XhoI* fragment in *BamHI* fragment #16, and the  
30 MDV gA gene was inserted behind *lacZ* as shown in Figures 6A and 6B. Flanking regions in *BamHI* #16 were used for the homologous recombination. HVT DNA and plasmid DNA were co-transfected according to the DNA TRANSFECTION FOR GENERATING RECOMBINANT HERPESVIRUS  
35 procedure into primary chick embryo fibroblast (CEF) cells. The virus from the transfection stock was purified by successive plaque purifications using the

BLUOGAL SCREEN FOR RECOMBINANT HERPESVIRUS procedure.  
At the end of this procedure, when 100% of the plaques  
were blue, the DNA was analyzed for the presence of the  
MDV gA gene. S-HVT-004 is a recombinant virus that  
5 contains both the  $\beta$ -galactosidase gene and the MDV gA  
gene incorporated into the genome.

Figure 6C shows the structure of S-HVT-004.

Example 4

## NEWCASTLE DISEASE VIRUS

5 Newcastle disease virus (NDV) is closely related to PI-  
3 in overall structure. Hemagglutinin (HN) and fusion  
(F) genes of PI-3 was engineered for expression in IBR  
(ref). Similarly hemagglutinin (HN) and fusion (F)  
genes was cloned from NDV for use in the herpesvirus  
10 delivery system (Herpesvirus of turkeys, HVT).

The procedures that was utilized for construction of  
herpesvirus control sequences for expression have been  
applied to NDV.

15

## INFECTIOUS BRONCHITIS VIRUS

Infectious bronchitis virus (IBV) is a virus of  
chickens closely related in overall structure to TGE.  
20 Major neutralizing antigen of TGE was engineered for  
expression in PRV (ref). Similarly major neutralizing  
antigens was cloned from three strains of IBV:  
Massachusetts (SEQ ID NOs: 14 and 15), Connecticut (SEQ  
ID NOs: 18 and 19), and Arkansas-99 (SEQ ID NOs: 16 and  
25 17) for use in a herpesvirus delivery system (HVT).

The procedures that was utilized for the construction  
of herpesvirus control sequences for expression have  
been applied to IBV.

30

EXAMPLE 5S-HVT-045

5 S-HVT-045 is a recombinant herpesvirus of turkeys that contains the Marek's disease virus (MDV) glycoprotein B (gB) gene inserted into the short unique region. The MDV antigen is more likely to elicit the proper antigenic response than the HVT equivalent antigen. S-  
10 HVT-045 has been deposited on October 15, 1992 pursuant to the Budapest Treaty on the International Deposit of Microorganisms for the Purposes of Patent Procedure with the Patent Culture Depository of the American Type Culture Collection, 12301 Parklawn Drive, Rockville,  
15 Maryland 20852 U.S.A. under ATCC Accession No. VR 2383.

The MDV gB gene was cloned by standard DNA cloning procedures. The MDV gB gene was localized to a 3.9 kb  
20 EcoRI-SalI fragment using an oligonucleotide probe based on the HSV gB sequence in a region found to be conserved among known herpesvirus gB genes. The restriction map 3.9 kb EcoRI-SalI fragment is similar to the published map (Ross et al., 1989).

25 For insertion into the HVT genome, the MDV gB was used intact because it would have good herpesvirus signal sequences already. The MDV gB gene was inserted into a cloned 17.15 kb BamHI-EcoRI fragment derived from the  
30 HVT BamHI #1 fragment. The site used for insertion was the StuI site within HVT US2, previously utilized for the construction of S-HVT-012. The site was initially altered by insertion of a unique HindIII linker, and the MDV gB gene was inserted by standard DNA cloning  
35 procedures. Flanking regions in the 17.15 kb BamHI-EcoRI fragment were used, together with the remaining cloned HVT fragments using the PROCEDURE FOR GENERATING

RECOMBINANT HERPESVIRUSES FROM OVERLAPPING SUBGENOMIC FRAGMENTS. The virus obtained from the transfection stock was plaque purified and the DNA was analyzed for the presence of the MDV gB gene. S-HVT-045 is a recombina-  
5 nt virus that contains the MDV gB gene incorporated into the genome at the StuI site in HVT US2 gene.

#### TESTING OF RECOMBINANT S-HVT-045

10

Two studies were conducted to demonstrate the effectiveness of these recombinant HVT/MDV viruses in protecting against challenge with virulent Marek's disease virus. In Study A, one-day-old specific  
15 pathogen free (SPF) chicks were vaccinated with either S-HVT-045 or S-HVT-046. Seven days post-vaccination, vaccinated chicks, and non-vaccinated, control chicks were challenged with the highly virulent MD-5 strain of Marek's disease virus. Following a 6-week post-  
20 challenge observation period for clinical signs typical of Marek's disease, all chicks were necropsied and examined for lesions diagnostic of Marek's disease. The results, in Table 6, show that both recombinant viruses gave complete protection against a challenge  
25 that caused Marek's disease in 90% of non-vaccinated control chicks.

In a second study, one-day-old chicks were vaccinated either with S-HVT-045 or S-HVT-047. A third group of  
30 chicks were vaccinated with a USDA-licensed, conventional vaccine comprised of HVT and SB-1 viruses. Five days post-vaccination, the vaccinated chicks and a group of non-vaccinated, control chicks were challenged with virulent Marek's virus, strain RB1B.  
35 The chicks were observed for 8 weeks for clinical signs of Marek's disease, then necropsied and observed for Marek's lesions. This study demonstrated the ability

101

of HVT-045 and HVT-047 to provide 100% protection against challenge (Table 1). The commercial vaccine gave 96% protection, and 79% of the non-vaccinated chicks developed Marek's disease.

Example 6S-HVT-012

5

S-HVT-012 is a recombinant herpesvirus of turkeys that contains the *E. coli*  $\beta$ -galactosidase (*lacZ*) gene inserted into the short unique region. The *lacZ* gene was used to determine the viability of this insertion site in HVT [ATCC F-126 ("Calnek")]. S-HVT-012 has been deposited on October 15, 1992 pursuant to the Budapest Treaty on the International Deposit of Microorganisms for the Purposes of Patent Procedure on with the Patent Culture Depository of the American Type Culture Collection, 12301 Parklawn Drive, Rockville, Maryland 20852 U.S.A. under ATCC Accession No. VR 2382.

10

15

20

25

30

35

For insertion into the genome of HVT, the  $\beta$ -galactosidase gene was introduced into the unique *StuI* site of the cloned *EcoRI* fragment #7 of HVT, i.e., the fragment containing the *StuI* site within the US2 gene of HVT (as described in Methods and Materials). Flanking regions of *EcoRI* fragment #7 were used for homologous recombination. HVT DNA and plasmid DNA were co-transfected according to the DNA TRANSFECTION FOR GENERATING RECOMBINANT VIRUS procedure into primary chick embryo fibroblast (CEF) cells. A blue virus obtained from the transfection stock was purified by successive plaque purifications using the BLUOGAL SCREEN FOR RECOMBINANT HERPESVIRUS procedure. At the end of this procedure, when 100% of the plaques were blue, the DNA was analyzed for the presence of the *lacZ* gene. S-HVT-012 is a recombinant virus that contains the *lacZ* gene incorporated into the genome at the *StuI* site within the US2 gene of HVT.

S-HVT-012 may be formulated as a vaccine in the same

manner as S-HVT-045. When administered to chickens, such a vaccine provides protection against Marek's disease virus.

5

### Example 7

#### Sites for Insertion of Foreign DNA into HVT

10 In order to define appropriate insertion sites, a library of HVT *Bam*HI and *Eco*RI restriction fragments was generated. Several of these restriction fragments (*Bam*HI fragments #16 and #13, and *Eco*RI fragments #6, #7, and #9 (see figure 1)) were subjected to  
15 restriction mapping analysis. One unique restriction site was identified in each fragment as a potential insertion site. These sites included *Xho*I in *Bam*HI fragments #13 and #16, and *Eco*RI fragment #9 and *Sal*I in *Eco*RI fragment #6 and *Stu*I in *Eco*RI fragment #7. A  
20  $\beta$ -galactosidase (*lacZ*) marker gene was inserted in each of the potential sites. A plasmid containing such a foreign DNA insert may be used according to the DNA COTRANSFECTION FOR GENERATING RECOMBINANT HERPESVIRUSES to CONSTRUCT a HVT containing the foreign DNA. For  
25 this procedure to be successful it is important that the insertion site be in a region non-essential to the replication of the HVT and that the site be flanked with HVT DNA appropriate for mediating homologous recombination between virus and plasmid DNAs. The  
30 plasmids containing the *lacZ* marker gene were utilized in the DNA COTRANSFECTION FOR GENERATING RECOMBINANT HERPESVIRUSES. The generation of recombinant virus was determined by the BLUOGAL SCREEN FOR RECOMBINANT HERPESVIRUS. Three of the five sites were successfully  
35 used to generate a recombinant virus. In each case the resulting virus was easily purified to 100%, clearly defining an appropriate site for the insertion of

foreign DNA. The three homology vectors used to define these sites are described below.

Example 7A

5

Homology Vector 172-29.31

10 The homology vector 172-29.31 contains the HVT *Bam*HI #16 fragment and is useful for the insertion of foreign DNA into HVT. Plasmid 172-29.31 contains a unique *Xho*I restriction site into which foreign DNA may be cloned. *Xho*I site in homology vector 172-29.31 may be used to insert foreign DNA into HVT by the construction of at least three recombinant HVT (see examples 1-3).

15

20 The homology vector 172-29.31 was further characterized by DNA sequence analysis. The complete sequences of the *Bam*HI #16 fragment was determined. Approximately 2092 base pairs of the adjacent *Bam*HI #13 fragment was also determined (see SEQ ID NO: 3). This sequence indicates that the open reading frame coding for HVT glycoprotein A (gA) spans the *Bam*HI #16 - *Bam*HI #13 junction. The HVT gA gene is homologous to the HSV-1 glycoprotein C (gC). The *Xho*I site interrupts an ORF which lies directly upstream of the HVT gA gene. This ORF shows amino acid sequence homology to the PRV p43 and the VZV gene 15. The PRV and VZV genes are the homologues of HSV-1 UL43. Therefore this ORF was designated as HVT UL43 (SEQ ID NO: 5). It should be noted that the HVT UL43 does not exhibit direct homology to HSV-1 UL43. Although HVT UL43 is located upstream of the HVT gC homologue it is encoded on the same DNA strand as HVT gA, where as the HSV-1 UL43 is on the opposite strand relative to HSV-1 gC. The *Xho*I site interrupts UL43 at approximately amino acid 6, suggesting that the UL43 gene is non-essential for HVT replication.

35

Example 7BHomology Vector 435-47.R17

5 The homology vector 435-47.R17 contains the HVT *EcoRI* #7 fragment and is useful for the insertion of foreign DNA into HVT. Plasmid 435-47.R17 contains a unique *HindIII* restriction site into which foreign DNA may be cloned. The *HindIII* restriction site in plasmid results  
10 from the insertion of a *HindIII* linker into the naturally occurring *StuI* site of *EcoRI* fragment #7. *HindIII* site in homology vector 435-47.R17 may be used to insert foreign DNA into HVT by the construction of at least 25 recombinant HVT.

15 DNA sequence analysis at the *StuI* indicated that this fragment contains open reading frames coding for US10, US2, and US3. The *StuI* site interrupts US2 at approximately amino acid 124, suggesting that the US2  
20 gene is non-essential for HVT replication.

Example 7CHomology Vector 172-63.1

25 The homology vector 172-63.1 contains the HVT *EcoRI* #9 fragment and is useful for the insertion of foreign DNA into HVT. Plasmid 172-63.1 contains a unique *XhoI* restriction site into which foreign DNA may be cloned.  
30 *XhoI* site in homology vector 172-63.1 may be used to insert foreign DNA into HVT by the construction of S-HVT-014 (see example 8).

Example 8S-HVT-014

5

S-HVT-014 is a recombinant herpesvirus of turkeys that contains the *E. coli*  $\beta$ -galactosidase (*lacZ*) gene inserted into the long unique region. The *lacZ* gene was used to determine the viability of this insertion site in HVT [ATCC F-126 ("Calnek")].

10

For insertion into the genome of HVT, the  $\beta$ -galactosidase gene was introduced into the unique *XhoI* site of the cloned *EcoRI* fragment #9 (as described in Methods and Materials). The *XhoI* site within the *EcoRI* #9 fragment of the HVT genome is the same site as the *XhoI* site within the *BamHI* #10 fragment used for construction recombinant herpesviruses of turkeys described in Examples 16 through 19. Flanking regions of *EcoRI* fragment #9 were used for homologous recombination. HVT DNA and plasmid DNA were co-transfected according to the DNA TRANSFECTION FOR GENERATING RECOMBINANT VIRUS procedure into primary chick embryo fibroblast (CEF) cells. A blue virus obtained from the transfection stock was purified by successive plaque purifications using the BLUOGAL SCREEN FOR RECOMBINANT HERPESVIRUS procedure. At the end of this procedure when 100% of the plaques were blue. S-HVT-014 is a recombinant virus that contains the *lacZ* gene incorporated into the genome at the *XhoI* site within the *EcoRI* #9 fragment of HVT.

15

20

25

30

S-HVT-014 may be formulated as a vaccine in the same manner as S-HVT-045. When administered to chickens, such a vaccine provides protection against Marek's disease virus.

35

Example 9S-HVT-005

5 S-HVT-005 is a recombinant herpesvirus of turkeys that contains the *E. coli*  $\beta$ -galactosidase (*lacZ*) gene inserted into the long unique region. The *lacZ* gene was used to determine the viability of this insertion site in HVT [ATCC F-126 ("Calnek")].

10

For insertion into the genome of HVT, the  $\beta$ -galactosidase gene was introduced into an approximately 1300 base pair deletion of the *Xho*I #9 fragment of HVT. The deletion which lies between the unique *Mlu*I and *Eco*RV sites removes the complete coding region of the HVT gA gene (see SEQ ID NO: 3). Flanking regions of *Xho*I fragment #9 were used for homologous recombination. HVT DNA and plasmid DNA were co-transfected according to the DNA TRANSFECTION FOR GENERATING RECOMBINANT VIRUS procedure into primary chick embryo fibroblast (CEF) cells. A blue virus obtained from the transfection stock was purified by successive plaque purifications using the BLUOGAL SCREEN FOR RECOMBINANT HERPESVIRUS procedure. At the end of this procedure, when 100% of the plaques were blue, the DNA was analyzed for the presence of the *lacZ* gene. S-HVT-005 is a recombinant virus that contains the *lacZ* gene incorporated into the genome in place of the deleted gA gene of HVT.

30

S-HVT-005 may be formulated as a vaccine in the same manner as S-HVT-045. When administered to chickens, such a vaccine provides protection against Marek's disease virus.

35

Example 10Marek's Disease Vaccines

5 Recombinant HVT expressing glycoproteins from Marek's  
Disease Virus make superior vaccines for Marek's  
Disease. We have constructed several recombinant HVT  
expressing MDV glycoproteins: S-HVT-004 (Example 3),  
S-HVT-045 (Example 5), S-HVT-046 (Example 10A), S-HVT-  
10 047 (Example 10B), S-HVT-062 (Example 10C).

Example 10A S-HVT-046

15 S-HVT-046 is a recombinant herpesvirus of turkeys that  
contains the Marek's disease virus (MDV) glycoprotein  
B (gB) and glycoprotein A (gA) genes inserted into the  
short unique region. The MDV genes are inserted in the  
same transcriptional orientation as the US2 gene. The  
MDV antigens are more likely to elicit the proper  
20 antigenic response than the HVT equivalent antigen.

S-HVT-046 was constructed according to the PROCEDURE  
FOR GENERATING RECOMBINANT HERPESVIRUS FROM SUBGENOMIC  
DNA FRAGMENTS. The following combination of subgenomic  
25 clones and enzymes were used: 407-32.2C3 with NotI,  
172-07.BA2 with BamHI, 407-32.5G6 with NotI, 407-32.1C1  
with NotI, 437-26.24 with BamHI and HindIII, 437-26.26  
with BamHI and HindIII, and 456-17.22 uncut. Insertion  
of the appropriate DNA was confirmed by southern blot  
30 analysis.

Example 10B S-HVT-047

S-HVT-047 is a recombinant herpesvirus of turkeys that contains the MDV gB and gA genes inserted into the short unique region. The MDV genes are inserted in the opposite transcriptional orientation as the US2 gene. The MDV antigens are more likely to elicit the proper antigenic response than the HVT equivalent antigen.

S-HVT-047 was constructed according to the PROCEDURE FOR GENERATING RECOMBINANT HERPESVIRUS FROM SUBGENOMIC DNA FRAGMENTS. The following combination of subgenomic clones and enzymes were used: 407-32.2C3 with NotI, 172-07.BA2 with BamHI, 407-32.5G6 with NotI, 407-32.1C1 with NotI, 437-26.24 with BamHI and HindIII, 437-26.26 with BamHI and HindIII, and 456-17.18 uncut. Insertion of the appropriate DNA was confirmed by southern blot analysis.

Example 10C S-HVT-062

S-HVT-062 is a recombinant herpesvirus of turkeys that contains the MDV gB, glycoprotein D (gD) and gA genes inserted into the short unique region. The MDV genes are inserted in the same transcriptional orientation as the US2 gene. The MDV antigens are more likely to elicit the proper antigenic response than the HVT equivalent antigen. S-HVT-062 has been deposited on February 23, 1993 pursuant to the Budapest Treaty on the International Deposit of Microorganisms for the Purposes of Patent Procedure with the Patent Culture Depository of the American Type Culture Collection, 12301 Parklawn Drive, Rockville, Maryland 20852 U.S.A. under ATCC Accession No. VR 2401.

S-HVT-062 was constructed according to the PROCEDURE FOR GENERATING RECOMBINANT HERPESVIRUS FROM SUBGENOMIC

DNA FRAGMENTS. The following combination of subgenomic clones and enzymes were used: 407-32.2C3 with *NotI*, 172-07.BA2 with *BamHI*, 407-32.5G6 with *NotI*, 407-32.1C1 with *NotI*, 437-26.24 with *BamHI* and *HindIII*, 556-60.6 with *BamHI* and *HindIII*, and 456-17.22 uncut. Insertion of the appropriate DNA was confirmed by southern blot analysis.

#### TESTING OF RECOMBINANT HVT EXPRESSING MDV ANTIGENS

10

Two studies were conducted to demonstrate the effectiveness of these recombinant HVT/MDV viruses in protecting against challenge with virulent Marek's disease virus. In Study 1, one-day-old specific pathogen free (SPF) chicks were vaccinated with either S-HVT-045, S-HVT-046, or S-HVT-047. Five days post-vaccination, vaccinated chicks, and non-vaccinated, control chicks were challenged with MDV. Following a 6-week post-challenge observation period for clinical signs typical of Marek's disease, all chicks were necropsied and examined for lesions diagnostic of Marek's disease. The results, in Table 7, show these recombinant viruses gave complete protection against a challenge that caused Marek's disease in 84% of non-vaccinated control chicks.

25

In the second study, one-day-old chicks were vaccinated with S-HVT-062. Two more groups of chicks were vaccinated with a USDA-licensed, conventional vaccines comprised of HVT and a combination HVT and SB-1 viruses. Five days post-vaccination, the vaccinated chicks and a group of non-vaccinated, control chicks were challenged with MDV. The chicks were observed for

30

111

8 weeks for clinical signs of Marek's disease, then necropsied and observed for Marek's lesions. This study demonstrated the ability of S-HVT-062 to provide 100% protection against challenge (Table 7). The commercial vaccines gave 81% and 95% protection, respectively and 100% of the non-vaccinated chicks developed Marek's disease.

112

TABLE 7 EFFICACY OF RECOMBINANT HVT/MDV VIRUSES AGAINST VIRULENT MAREK'S VIRUS CHALLENGE

5	Study	Vaccine Group	Dose <sup>a</sup>	Protection <sup>b</sup>
	1	S-HVT-045	2.2 X 10 <sup>3</sup>	24/24 (100%)

Example 11Bivalent Vaccines Against Newcastle Disease and Marek's Disease

5

Recombinant HVT expressing proteins from NDV make bivalent vaccines protecting against both Marek's Disease and Newcastle disease. Several recombinant HVT expressing NDV proteins were constructed S-HVT-007 (Example 11A), S-HVT-048 (Example 11B), S-HVT-049 (Example 11C), S-HVT-050 (Example 11D), and S-HVT-106 (Example 11E).

10

Example 11A S-HVT-007

15

S-HVT-007 is a recombinant herpesvirus of turkeys that contains a *E. coli* lacZ NDV HN hybrid protein gene under the control of the PRV gX promoter and the NDV F gene under the control of the HSV-1  $\alpha 4$  promoter inserted into the long unique region. The NDV genes are inserted in the same transcriptional orientation as the UL43 gene.

20

To construct S-HVT-007, HVT DNA and the plasmid 255-18.B16 were co-transfected according to the DNA TRANSFECTION FOR GENERATING RECOMBINANT VIRUS procedure into primary chick embryo fibroblast (CEF) cells. A blue virus obtained from the transfection stock was purified by successive plaque purifications using the BLUOGAL SCREEN FOR RECOMBINANT HERPESVIRUS procedure. At the end of this procedure, when 100% of the plaques were blue.

25

30

Example 11B S-HVT-048

S-HVT-048 is a recombinant herpesvirus of turkeys that contains the MDV gB and gA genes and the NDV F gene under the control of the HCMV immediate early promoter inserted into the short unique region. The MDV and NDV genes are inserted in the same transcriptional orientation as the US2 gene.

S-HVT-048 was constructed according to the PROCEDURE FOR GENERATING RECOMBINANT HERPESVIRUS FROM SUBGENOMIC DNA FRAGMENTS. The following combination of subgenomic clones and enzymes were used: 407-32.2C3 with NotI, 172-07.BA2 with BamHI, 407-32.5G6 with NotI, 407-32.1C1 with NotI, 437-26.24 with BamHI and HindIII, 437-26.26 with BamHI and HindIII, and 535-70.3 uncut. Insertion of the appropriate DNA was confirmed by southern blot analysis.

Example 11C S-HVT-049

S-HVT-049 is a recombinant herpesvirus of turkeys that contains the MDV gB and gA genes and the NDV HN gene under the control of the PRV gX promoter inserted into the short unique region. The MDV and NDV genes are inserted in the same transcriptional orientation as the US2 gene.

S-HVT-049 was constructed according to the PROCEDURE FOR GENERATING RECOMBINANT HERPESVIRUS FROM SUBGENOMIC DNA FRAGMENTS. The following combination of subgenomic clones and enzymes were used: 407-32.2C3 with NotI, 172-07.BA2 with BamHI, 407-32.5G6 with NotI, 407-32.1C1 with NotI, 437-26.24 with BamHI and HindIII, 437-26.26 with BamHI and HindIII, and 549-62.10 uncut. Insertion of the appropriate DNA was confirmed by southern blot analysis.

Example 11D S-HVT-050

S-HVT-050 is a recombinant herpesvirus of turkeys that contains the MDV gB and gA genes and the NDV HN (SEQ ID  
5 NOs: 10 and 11) and F (SEQ ID NOs: 12 and 13) genes. The NDV genes are under the control of the PRV gX and HCMV immediately promoters respectively. All four genes are inserted into the short unique region in the same transcriptional orientation as the US2 gene.

10 S-HVT-050 was constructed according to the PROCEDURE FOR GENERATING RECOMBINANT HERPESVIRUS FROM SUBGENOMIC DNA FRAGMENTS. The following combination of subgenomic clones and enzymes were used: 407-32.2C3 with NotI,  
15 172-07.BA2 with BamHI, 407-32.5G6 with NotI, 407-32.1C1 with NotI, 437-26.24 with BamHI and HindIII, 437-26.26 with BamHI and HindIII, and 549-24.15 uncut. Insertion of the appropriate DNA was confirmed by southern blot analysis. S-HVT-050 has been deposited on February 23,  
20 1993 pursuant to the Budapest Treaty on the International Deposit of Microorganisms for the Purposes of Patent Procedure with the Patent Culture Depository of the American Type Culture Collection, 12301 Parklawn Drive, Rockville, Maryland 20852 U.S.A.  
25 under ATCC Accession No. VR 2400.

Example 11E S-HVT-106

30 S-HVT-106 is a recombinant herpesvirus of turkeys that contains the MDV gA, gB, gD genes and the NDV HN and F genes. The NDV genes are under the control of the PRV gX and HCMV immediately promoters respectively. All five genes are inserted into the short unique region in the same transcriptional orientation as the US2 gene.

35 S-HVT-106 was constructed according to the PROCEDURE FOR GENERATING RECOMBINANT HERPESVIRUS FROM SUBGENOMIC

DNA FRAGMENTS. The following combination of subgenomic clones and enzymes were used: 407-32.2C3 with *Not*I, 172-07.BA2 with *Bam*HI, 407-32.5G6 with *Not*I, 407-32.1C1 with *Not*I, 437-26.24 with *Bam*HI and *Hind*III, 437-26.26 with *Bam*HI and *Hind*III, and 633-13.27 uncut.

#### TESTING OF RECOMBINANT HVT EXPRESSING NDV ANTIGENS

Two studies were conducted to demonstrate the effectiveness of these recombinant HVT/MDV/NDV viruses in protecting against challenge with virulent Newcastle and Marek's disease viruses. In Study 1, one-day-old specific pathogen free (SPF) chicks were vaccinated with either S-HVT-048, S-HVT-049, S-HVT-050, or a USDA-licensed, conventional vaccine comprised of NDV B1/B1 virus. Three weeks post-vaccination, vaccinated chicks, and non-vaccinated, control chicks were challenged with NDV. Birds were then observed for clinical signs of disease. The results, in Table 8, show these recombinant viruses (S-HVT-048 and S-HVT-050) gave complete protection against a challenge that caused Newcastle disease in 100% of non-vaccinated control chicks. Recombinant virus S-HVT-049 gave partial protection against Newcastle disease.

In the second study, one-day-old chicks were vaccinated with S-HVT-050. Two more groups of chicks were vaccinated with a USDA-licensed, conventional vaccines comprised of HVT and a combination HVT and SB-1 viruses. Five days post-vaccination, the vaccinated chicks and a group of non-vaccinated, control chicks were challenged with MDV. The chicks were observed for 8 weeks for clinical signs of Marek's disease, then necropsied and observed for Marek's lesions. This study demonstrated the ability of S-HVT-050 to provide protection greater than the commercial Marek's disease vaccines.

Example 12Bivalent Vaccines Against Infectious Laryngotracheitis and Marek's Disease

5

Recombinant HVT expressing glycoproteins from ILT virus make bivalent vaccines protecting against both Marek's disease and infectious laryngotracheitis. Several recombinant HVT expressing ILT virus glycoproteins S-HVT-051 (Example 12A), S-HVT-052 (Example 12B), and S-HVT-104 (Example 11C) were constructed.

10

Example 12A S-HVT-051

15

S-HVT-051 is a recombinant herpesvirus of turkeys that contains the ILT virus gB gene inserted into the short unique region. The ILT gene is inserted in the same transcriptional orientation as the US2 gene.

20

S-HVT-051 was constructed according to the PROCEDURE FOR GENERATING RECOMBINANT HERPESVIRUS FROM SUBGENOMIC DNA FRAGMENTS. The following combination of subgenomic clones and enzymes were used: 407-32.2C3 with NotI, 172-07.BA2 with BamHI, 407-32.5G6 with NotI, 407-32.1C1 with NotI, 437-26.24 with BamHI and HindIII, 437-26.26 with BamHI and HindIII, and 528-11.34 uncut. Insertion of the appropriate DNA was confirmed by southern blot analysis.

25

Example 12B S-HVT-052

30

S-HVT-052 is a recombinant herpesvirus of turkeys that contains the ILT virus gD gene inserted into the short unique region. The ILT gene is inserted in the opposite transcriptional orientation as the US2 gene.

35

S-HVT-052 was constructed according to the PROCEDURE FOR GENERATING RECOMBINANT HERPESVIRUS FROM SUBGENOMIC DNA FRAGMENTS. The following combination of subgenomic clones and enzymes were used: 407-32.2C3 with NotI, 172-07.BA2 with BamHI, 407-32.5G6 with NotI, 407-32.1C1 with NotI, 437-26.24 with BamHI and HindIII, 437-26.26 with BamHI and HindIII, and 528-03.37 uncut. Insertion of the appropriate DNA was confirmed by southern blot analysis.

#### Example 12C S-HVT-104

S-HVT-104 is a recombinant herpesvirus of turkeys that contains six foreign genes. The MDV gA, gB, and gD genes are inserted in the unique short region in the same transcriptional orientation as the US2 gene. An *E. coli lacZ* marker gene and the ILT gB and gD genes are inserted in BamHI #16 region in the same transcriptional orientation as the UL43 gene.

To construct S-HVT-104, DNA from S-HVT-062 and the plasmid 634-29.16 were co-transfected according to the DNA TRANSFECTION FOR GENERATING RECOMBINANT VIRUS procedure into primary chick embryo fibroblast (CEF) cells.

#### TESTING OF RECOMBINANT HVT EXPRESSING ILT ANTIGENS

The following study was conducted to demonstrate the effectiveness of these recombinant HVT/ILT viruses in protecting against challenge with virulent Infectious Laryngotracheitis virus. One-day-old specific pathogen free (SPF) chicks were vaccinated with either S-HVT-051, S-HVT-052, a combination of S-HVT-051 and S-HVT-052, or a USDA-licensed, conventional vaccine comprised of ILT virus. Two to three weeks post-vaccination, vaccinated chicks, and non-vaccinated, control chicks

120

5 were challenged with ILT. Birds were then observed for clinical signs of disease. The results, in Table 9, show these recombinant viruses (S-HVT-051 and S-HVT-052) gave protection against challenge with ILT virus comparable to a commercial ILT vaccine.

10 Animals vaccinated with the vaccines described here may be easily differentiated from animals infected with virulent ILT. This is accomplished by testing the suspect birds for antibodies to any ILT antigens other than gB or gD. Examples of such antigens are ILT glycoproteins C, E, and G. Vaccinated, uninfected birds will be negative for these antigens whereas infected birds will be positive.

15

121

TABLE 9 EFFICACY OF RECOMBINANT HVT/ILT VIRUSES AGAINST VIRULENT INFECTIOUS LARYNGOTRACHEITIS VIRUS CHALLENGE

5	Vaccine Group	Dose <sup>a</sup>	Protection <sup>b</sup>

15	<sup>b</sup> No.protected/Total; Challenge 2-3 weeks post-vaccination.		
	<sup>c</sup> Commercial vaccine.		

Example 13Bivalent Vaccines Against Infectious Bursal Disease and Marek's Disease

5

Recombinant HVT expressing proteins from IBDV make bivalent vaccines protecting against both Marek's Disease and infectious bursal disease. Several recombinant HVT expressing IBDV proteins were constructed. These viruses include S-HVT-003 (example 2) and S-HVT-096.

10

S-HVT-096 is a recombinant herpesvirus of turkeys that contains the IBDV VP2 gene, under the control of the HCMV immediate early promoter, inserted into the short unique region. The IBDV gene is inserted in the same transcriptional orientation as the US2 gene.

15

S-HVT-096 was constructed according to the PROCEDURE FOR GENERATING RECOMBINANT HERPESVIRUS FROM SUBGENOMIC DNA FRAGMENTS. The following combination of subgenomic clones and enzymes were used: 407-32.2C3 with NotI, 172-07.BA2 with BamHI, 407-32.5G6 with NotI, 407-32.1C1 with NotI, 437-26.24 with BamHI and HindIII, 556-60.6 with BamHI, and 602-57.F1 uncut. Insertion of the appropriate DNA was confirmed by southern blot analysis.

20

25

S-HVT-096 was assayed for expression of VP2 by black plaque and western blot analysis. Both assays indicated that the virus was expressing high levels of protein which reacts specifically with an IBDV neutralizing monoclonal antibody. This virus will be useful as a vaccine against infectious bursal disease.

30

35

Example 14Bivalent Vaccines Against Infectious Bronchitis and Marek's Disease

5

S-HVT-066 is a recombinant herpesvirus of turkeys that contains the MDV gB, gD and gA genes and the IBV spike and matrix genes. The IBV spike and matrix genes are under the control of the HCMV immediate early and PRV gX promoters respectively. All five genes are inserted into the short unique region. The MDV and IBV genes are inserted in the same transcriptional orientation as the US2 gene.

10

15

S-HVT-066 was constructed according to the PROCEDURE FOR GENERATING RECOMBINANT HERPESVIRUS FROM SUBGENOMIC DNA FRAGMENTS. The following combination of subgenomic clones and enzymes were used: 407-32.2C3 with NotI, 172-07.BA2 with BamHI, 407-32.5G6 with NotI, 407-32.1C1 with NotI, 437-26.24 with BamHI and HindIII, 556-60.6 with BamHI, and 567-72.1D uncut. Insertion of the appropriate DNA was confirmed by southern blot analysis.

20

25

S-HVT-066 was assayed for expression of the IBV spike protein by black plaque and western blot analysis. Both assays indicated that the virus was expressing high levels of protein which reacts specifically with an IBV neutralizing monoclonal antibody. This virus will be useful as a vaccine against infectious bronchitis.

30

**Example 15****Vaccines utilizing HVT to express antigens from various pathogens.**

5 Anticipate that antigens from the following pathogens may also be utilized to develop poultry vaccines: Chick anemia virus (agent), Avian encephalomyelitis virus, Avian reovirus, Avian paramyxoviruses, Avian influenza  
10 virus, Avian adenovirus, Fowl pox virus, Avian coronavirus, Avian rotavirus, Salmonella spp, E. coli, Pasteurella spp, Haemophilus spp, Chlamydia spp, Mycoplasma spp, Campylobacter spp, Bordetella spp, Poultry nematodes, cestodes, trematodes, Poultry  
15 mites/lice, Poultry protozoa (Eimeria spp, Histomonas spp, Trichomonas spp).

**Example 16**

20 Trivalent vaccines against Infectious Laryngotracheitis, Marek's Disease and Newcastle's Disease and bivalent vaccines against Infectious Laryngotracheitis and Marek's Disease are described. Superior protection against Infectious  
25 Laryngotracheitis is achieved with a vaccine combining S-HVT-123 (expressing ILTV gB and gD) with S-HVT-138, -139, or 140 (expressing ILTV gD and gI).

**Example 16A S-HVT-123**

30 S-HVT-123 is a recombinant herpesvirus of turkeys that contains the ILT virus gB and gD genes inserted into an XhoI site converted to a NotI site in the EcoRI #9 (BamHI #10) fragment of the HVT genome (Figures 13B and  
35 15; SEQ ID NO: 48). S-HVT-123 further contains the MDV gA, gD, and gB genes inserted into a unique StuI site converted into a HindIII site in the HVT US2 gene. The

125

ILTV genes and the MDV genes each use their own respective promoters. S-HVT-123 is useful as a vaccine in poultry against Infectious Laryngotracheitis and Marek's Disease.

5

S-HVT-123 was constructed according to the PROCEDURE FOR GENERATING RECOMBINANT HERPESVIRUS FROM OVERLAPPING SUBGENOMIC FRAGMENTS. The following combination of subgenomic clones and enzymes were used: 407-32.2C3 with NotI, 172-07.BA2 with BamHI, 407-32.5G6 with NotI, 10 672-07.C40 with NotI, 672-01.A40 with NotI, 721-38.1J uncut, 729-37.1 with AscI.

Example 16B S-HVT-138

15

S-HVT-138 is a recombinant herpesvirus of turkeys that contains the ILT virus gD and gI genes inserted into a unique XhoI site converted to a PacI site in the EcoRI #9 (BamHI #10) fragment of the HVT genome (Figures 13A and 15). The ILTV gD and gI genes are in the opposite transcriptional orientation to the open reading frame (ORF A) within the EcoRI #9 (BamHI #10) fragment of the HVT genome (Figure 14; SEQ ID NOs: 48, 50). The ILTV gD and gI genes are expressed as overlapping transcripts from endogenous ILTV promoters, and share their own endogenous polyadenylation signal.

20

25

S-HVT-138 is useful as a vaccine in poultry against Infectious Laryngotracheitis and Marek's Disease.

30

S-HVT-138 was constructed according to the PROCEDURE FOR GENERATING RECOMBINANT HERPESVIRUS FROM OVERLAPPING SUBGENOMIC FRAGMENTS. The following combination of subgenomic clones and enzymes were used: 407-32.2C3 with NotI, 172-07.BA2 with BamHI, 407-32.5G6 with NotI, 35 672-07.C40 with NotI, 672-01.A40 with NotI, 711-92.1A uncut, 415-09.BA1 with BamHI.

126

Sera from S-HVT-138 vaccinated chickens reacts on Western blots with ILTV gI protein indicating that the S-HVT-138 vaccine expressed the ILTV protein and does elicit an immune response in birds. S-HVT-138 vaccinated chickens were protected from challenge by virulent infectious laryngotracheitis virus.

Example 16C S-HVT-139

S-HVT-139 is a recombinant herpesvirus of turkeys that contains the ILT virus gD and gI genes inserted into a unique *XhoI* site converted to a *PacI* site in the *EcoRI* #9 (*BamHI* #10) fragment of the HVT genome. The ILTV gD and gI genes are in the opposite transcriptional orientation to the open reading frame (ORF A) within the *EcoRI* #9 (*BamHI* #10) fragment of the HVT genome (Figure 13A and 15; SEQ ID NO: 48, 50). S-HVT-139 further contains the MDV gA, gD, and gB genes are inserted into the unique *StuI* site converted into a *HindIII* site in the HVT US2 gene. The ILTV gD and gI genes are expressed as overlapping transcripts from their own respective endogenous ILTV promoters, and the MDV genes are also expressed from their own endogenous promoters. S-HVT-139 is useful as a vaccine in poultry against Infectious Laryngotracheitis and Marek's Disease.

S-HVT-139 was constructed according to the PROCEDURE FOR GENERATING RECOMBINANT HERPESVIRUS FROM OVERLAPPING SUBGENOMIC FRAGMENTS. The following combination of subgenomic clones and enzymes were used: 407-32.2C3 with *NotI*, 172-07.BA2 with *BamHI*, 407-32.5G6 with *NotI*, 672-07.C40 with *NotI*, 672-01.A40 with *NotI*, 711-92.1A uncut, 721-38.1J uncut.

Example 16D S-HVT-140

S-HVT-140 is a recombinant herpesvirus-of turkeys that contains the ILT virus gD and gI genes inserted into a unique *Xho*I site converted to a *Pac*I site in the *Eco*R1 #9 (*Bam*HI #10) fragment of the HVT genome (Figures 13A and 15). The ILTV gD and gI genes are in the opposite transcriptional orientation to the open reading frame (ORF A) within the *Eco*R1 #9 (*Bam*HI #10) fragment of the HVT genome (Figure 14; SEQ ID NO: 48, 50). S-HVT-140 further contains the MDV gA, gD, and gB genes and the NDV F and HN genes inserted into a unique *Stu*I site converted into a *Hind*III site in the HVT US2 gene. The ILTV gD and gI genes are expressed as overlapping transcripts from their own respective endogenous ILTV promoters, and the MDV genes are also expressed from their own respective endogenous MDV promoters. The NDV F gene is transcribed from the HCMV immediate early promoter, and the NDV HN gene is transcribed from the PRV gX promoter. S-HVT-140 is useful as a vaccine in poultry against Infectious Laryngotracheitis, Marek's Disease, and Newcastle's Disease.

S-HVT-140 was constructed according to the PROCEDURE FOR GENERATING RECOMBINANT HERPESVIRUS FROM OVERLAPPING SUBGENOMIC FRAGMENTS. The following combination of subgenomic clones and enzymes were used: 407-32.2C3 with *Not*I, 172-07.BA2 with *Bam*HI, 407-32.5G6 with *Not*I, 672-07.C40 with *Not*I, 672-01.A40 with *Not*I, 711-92.1A uncut, 722-60.E2 uncut.

### Example 17

Trivalent vaccines against Infectious Bursal Disease, Marek's Disease and Newcastle's Disease and bivalent vaccines against Infectious Bursal Disease and Marek's Disease are described.

### Example 17A HVT-126

128

S-HVT-126 is a recombinant herpesvirus of turkeys that contains the IBDV VP2 gene inserted into an *Xho*I site converted to a *Pac*I site in the *Eco*R1 #9 (*Bam*HI #10) fragment in the HVT genome (Figures 13A and 15). The IBDV gene is in the same transcriptional orientation as the open reading frame (ORF A) within the *Eco*R1 #9 (*Bam*HI #10) fragment of the HVT genome (Figure 14; SEQ ID NO: 48, 50). The IBDV VP2 gene is expressed from an IBRV VP8 promoter. S-HVT-126 is useful as a vaccine in poultry against Infectious Bursal Disease and Marek's Disease.

S-HVT-126 was constructed according to the PROCEDURE FOR GENERATING RECOMBINANT HERPESVIRUS FROM OVERLAPPING SUBGENOMIC FRAGMENTS. The following combination of subgenomic clones and enzymes were used: 407-32.2C3 with *Not*I, 172-07.BA2 with *Bam*HI, 407-32.5G6 with *Not*I, 672-07.C40 with *Not*I, 672-01.A40 with *Not*I, 706-57.A3 uncut, 415-09.BA1 with *Bam*HI.

#### Example 17B HVT-137

S-HVT-137 is a recombinant herpesvirus of turkeys that contains the IBDV VP2 gene inserted into a unique *Xho*I site converted to a *Pac*I site in the *Eco*R1 #9 (*Bam*HI #10) fragment in the HVT genome (Figures 13A and 15). The IBDV gene is in the same transcriptional orientation as the open reading frame (ORF A) within the *Eco*R1 #9 (*Bam*HI #10) fragment of the HVT genome (Figure 14; SEQ ID NO: 48, 50). S-HVT-137 further contains the MDV gA, gD, and gB genes inserted into a unique *Stu*I site converted into a *Hind*III site in the HVT US2 gene. The IBDV VP2 gene is expressed from an IBRV VP8 promoter. The MDV genes are expressed from their own respective endogenous MDV promoters. S-HVT-137 is useful as a vaccine in poultry against Infectious Bursal Disease and Marek's Disease.

129

S-HVT-137 was constructed according to the PROCEDURE FOR GENERATING RECOMBINANT HERPESVIRUS FROM OVERLAPPING SUBGENOMIC FRAGMENTS. The following combination of subgenomic clones and enzymes were used: 407-32.2C3 with NotI, 172-07.BA2 with BamHI, 407-32.5G6 with NotI, 672-07.C40 with NotI, 672-01.A40 with NotI, 706-57.A3 uncut, 721-38.1J uncut.

Example 17C HVT-143

S-HVT-143 is a recombinant herpesvirus of turkeys that contains the IBDV VP2 gene inserted into a unique XhoI site converted to a PacI site in the EcoRI #9 (BamHI #10) fragment of the HVT genome (Figures 13 A and 15). The IBDV gene is in the same transcriptional orientation as the open reading frame (ORF A) within the EcoRI #9 (BamHI #10) fragment of the HVT genome (Figure 14; SEQ ID NO: 48, 50). S-HVT-143 further contains the MDV gA, gD, and gB genes and the NDV F and HN genes inserted into a unique StuI site converted into a HindIII site in the HVT US2 gene. The IBDV VP2 gene is expressed from an IBRV VP8 promoter. The MDV genes are expressed from their own respective endogenous MDV promoters. The NDV F gene is transcribed from the HCMV immediate early promoter, and the NDV HN gene is transcribed from the PRV gX promoter. S-HVT-143 is useful as a vaccine in poultry against Infectious Bursal Disease, Marek's Disease, and Newcastle's Disease.

S-HVT-143 was constructed according to the PROCEDURE FOR GENERATING RECOMBINANT HERPESVIRUS FROM OVERLAPPING SUBGENOMIC FRAGMENTS. The following combination of subgenomic clones and enzymes were used: 407-32.2C3 with NotI, 172-07.BA2 with BamHI, 407-32.5G6 with NotI, 672-07.C40 with NotI, 672-01.A40 with NotI, 706-57.A3 uncut, 722-60.E2 uncut.

**Example 18** **HVT-128**

S-HVT-128 is a recombinant herpesvirus of turkeys that contains the NDV HN and F genes inserted into a unique *Xho*I site converted to a *Pac*I site in the *Eco*R1 #9 (BamHI #10) fragment of the HVT genome (Figures 13A and 15). S-HVT-128 further contains the MDV gA, gD, and gB genes inserted into a unique *Stu*I site converted into a *Hind*III site in the HVT US2 gene. The NDV HN gene is expressed from the PRV gX promoter and the NDV F gene is expressed from the HCMV immediate early promoter. The MDV genes are expressed from the endogenous MDV promoters. S-HVT-128 is useful as a vaccine in poultry against Newcastle's Disease and Marek's Disease.

S-HVT-128 was constructed according to the PROCEDURE FOR GENERATING RECOMBINANT HERPESVIRUS FROM OVERLAPPING SUBGENOMIC FRAGMENTS. The following combination of subgenomic clones and enzymes were used: 407-32.2C3 with *Not*I, 172-07.BA2 with *Bam*HI, 407-32.5G6 with *Not*I, 672-07.C40 with *Not*I, 672-01.A40 with *Not*I, and 717-38.12 uncut. To a mixture of these six cosmids was added a limiting dilution of a recombinant HVT virus containing the MDV gA, gD, and gB genes inserted into the unique short region (see HVT-062) and the PRV gX promoter-lacZ gene inserted into an *Xho*I site converted to a *Not*I site in the *Eco*R1 #9 (BamHI #10) fragment within the unique long region of HVT. A recombinant virus S-HVT-128 was selected which was lac Z negative.

**Example 18B** **HVT-136**

S-HVT-136 is a recombinant herpesvirus of turkeys that contains the NDV HN and F genes inserted into an *Xho*I site converted to a *Pac*I site in the *Eco*R1 #9 (BamHI #10) fragment within the unique long region of HVT. (Figure 14; SEQ ID NOs: 48 and 50) The NDV HN gene is

131

expressed from the PRV gX promoter and the NDV F gene is expressed from the HCMV immediate early promoter. S-HVT-136 is useful as a vaccine in poultry against Newcastle's disease and Marek's disease.

5

S-HVT-136 was constructed according to the PROCEDURE FOR GENERATING RECOMBINANT HERPESVIRUS FROM OVERLAPPING SUBGENOMIC FRAGMENTS. The following combination of subgenomic clones and enzymes were used: 407-32.2C3 with NotI, 172-07.BA2 with BamHI, 407-32.5G6 with NotI, 672-07.C40 with NotI, 672-01.A40 with NotI, and 717-38.12 uncut, and 415-09.BA1 with BamHI.

10

15     Example 19     S-HVT-145

HVT/MDV recombinant virus vaccine

20

25

30

35

S-HVT-145 is a recombinant virus vaccine containing MDV and HVT genomic sequences which protects against Marek's disease is produced by combining cosmid of MDV genomic DNA containing genes coding for the relevant protective antigens of virulent MDV serotype 2 and cosmid of HVT genomic DNA according to the PROCEDURE FOR GENERATING RECOMBINANT HERPESVIRUS FROM OVERLAPPING SUBGENOMIC FRAGMENTS. The resulting virus is a vaccine that has the protective immune response to virulent MDV serotype 2 and the attenuated growth characteristics of the HVT. In one embodiment, a chimeric virus vaccine containing the MDV genes of the unique short and the HVT genes of the unique long is useful as a vaccine against Marek's disease in chickens. The MDV protective antigens within the unique short (gD, gE, and gI) elicit a protective immune response to MDV, while the virulence elements present in the unique long of MDV (55, 56, 57) are replaced by the attenuating unique long sequences of HVT. The result is an attenuated

132

virus vaccine which protects against Marek's disease. Multivalent protection against Marek's disease, infectious laryngotracheitis, infectious bursal disease, Newcastle's disease, or another poultry pathogen is achieved by inserting the ILTV gB, gD, and gI genes, the IBDV VP2 gene, the NDV HN and F genes, or an antigen gene from a poultry pathogen into an XhoI site converted to a PacI site or NotI site in the EcoRI #9 (BamHI #10) fragment within the unique long region of HVT/MDV recombinant virus (Figures 13 and 15).

A cosmid was constructed containing the entire MDV unique short region. MDV genomic DNA contains several SmaI sites in the unique long and internal and terminal repeats of the virus, but no SmaI sites within the unique short of the virus. The entire unique short region of MDV was isolated by a partial restriction digestion of MDV genomic DNA with SmaI. A DNA fragment approximately 29,000 to 33,000 base pairs was isolated and cloned into a blunt ended site of the cosmid vector pWE15. To generate HVY-145, a recombinant HVT/MDV chimeric virus, the cosmid containing the MDV unique short region was combined with cosmids containing the HVT unique long region according to the PROCEDURE FOR GENERATING RECOMBINANT HERPESVIRUS FROM OVERLAPPING SUBGENOMIC FRAGMENTS. The following combination of subgenomic clones and enzymes were used: 407-32.2C3 with NotI, 172-07.BA2 with BamHI, 407-32.5G6 with NotI, 407-32.1C1 with NotI, and 739-27.16 with NotI.

The resulting virus vaccine provides superior protection against Marek's disease or as a multivalent vaccine against Marek's disease and infectious laryngotracheitis, infectious bursal disease, Newcastle's disease, or another poultry pathogen. This vaccine is superior because expression of MDV genes in the HVT/MDV chimera vaccine is safer and provides

better protection against Marke's disease than vaccines presently available containing HVT and MDV type 1 (SB-1) or HVT alone. Secondly, one can demonstrate expression of the MDV glycoprotein genes in the absence of the homologous HVT genes for both diagnostic and regulatory purposes. This is useful since antibodies to an MDV glycoprotein will cross react with the homologous HVT glycoprotein. Finally, a recombinant HVT/MDV virus which contains a single copy of each glycoprotein gene is more stable than a recombinant virus containing two copies of a homologous glycoprotein gene from HVT and MDV which may delete by homologous recombination.

In an alternative embodiment, cosmids containing MDV protective antigen genes from the unique long (MDV gB and gC) are combined with cosmids containing HVT gene sequences from the unique short and the unique long, effectively avoiding the MDV virulence genes at the unique long/internal repeat junction and the unique long/terminal repeat junction (55, 56, and 57).

SB-1 strain is an MDV serotype 1 with attenuated pathogenicity. Vaccination with a combination of HVT and SB-1 live viruses protects against virulent MDV challenge better than vaccination with either virus alone. In an alternative embodiment of the present invention, a recombinant virus vaccine comprises protective antigen genes of the virulent MDV serotypes 2 combined with the attenuating genes of the non-virulent MDV serotypes 1 and 3, such as SB-1 and HVT. The genomic DNA corresponding to the unique long region is contributed by the SB-1 serotype. The genomic DNA corresponding to the unique short region is contributed by the HVT serotype. Three major glycoprotein antigens (gB, gA and gD) from the MDV serotype 2 are inserted into the unique short region of the virus.

The recombinant virus is constructed utilizing HVT subgenomic clones 672-01.A40, 672-07.C40 and 721-38.1J to reconstruct the unique short region. Subgenomic clone 721-38.1J contains an insertion of the MDV gB, gA, and gD genes. A large molar excess of these clones is cotransfected with a sub-infectious dose of Sb-1 genomic DNA. To determine the appropriate sub-infectious dose, transfection of the SB-1 is titrated down to a dose which no longer yields virus plaques in cell culture. Such a dose contains sub-genomic fragments spanning the unique long region of SB-1 which recombine with the HVT unique short subgenomic clones. Therefore, a virus resulting from recombination between overlapping homologous regions of the SB-1 and HVT subgenomic fragments is highly favored. Alternatively, SB-1 genomic fragments from the unique long region are subcloned into cosmid vectors. A recombinant virus containing the Sb-1 unique long the HVT unique short with the MDV, gB, gA, and gD genes were produced using the PROCEDURE FOR GENERATING RECOMBINANT HERPESVIRUS FROM OVERLAPPING SUBGENOMIC FRAGMENTS. This procedure is also used with an HVT subgenomic clone to insert antigen genes from other avian pathogens including but not limited to infectious laryngotracheitis virus, Newcastle's disease virus and infectious bursal disease virus.

#### Example 20

Recombinant HVT expressing chicken myelomonocytic growth factor (cMGF) or chicken interferon (cIFN) are useful as vaccines against Marek's disease virus and are also useful to enhance the immune response against other diseases of poultry. Chicken myelomonocytic growth factor (cMGF) is related to mammalian G-CSF and interleukin-6 protein (58), and chicken interferon (cIFN) is homologous to mammalian type 1 interferon

135

(59) interferon. When used in combination with vaccines described in previous examples, S-HVT-144 or HVT expressing cIFN are useful to provide enhanced mucosal, humoral, or cell mediated immunity against avian disease-causing viruses including, but not limited to, Marek's disease virus, Newcastle disease virus, infectious laryngotracheitis virus, infectious bronchitis virus, infectious bursal disease virus. Recombinant HVT expressing cMGF or cIFN are useful provide enhanced immunity against avian disease causing organisms described in Example 15.

**Example 20A** S-HVT-144

S-HVT-144 is a recombinant herpesvirus of turkeys that contains the chicken myelomonocytic growth factor (cMGF) gene inserted into an XhoI site converted to a PacI site in the EcoRI #9 fragment within the unique long region of HVT. The cMGF gene is in the opposite transcriptional orientation to the open reading frame (ORF A) within the EcoRI #9 fragment of the HVT genome (Figure 14; SEQ ID NOS: 48 and 50). The cMGF gene is expressed from a human cytomegalovirus immediate early promoter. S-HVT-144 is useful as a vaccine in poultry against Marek's Disease.

S-HVT-144 was constructed according to the PROCEDURE FOR GENERATING RECOMBINANT HERPESVIRUS FROM OVERLAPPING SUBGENOMIC FRAGMENTS. The following combination of subgenomic clones and enzymes were used: 407-32.2C3 with NotI, 172-07.BA2 with BamHI, 407-32.5G6 with NotI, 672-07.C40 with NotI, 672-01.A40 with NotI, 751-87.A8 with Asc I, 415-09.BA1 with BamHI.

**Example 20B** Recombinant HVT expressing chicken interferon

A recombinant herpesvirus of turkeys contains the chicken interferon (cIFN) gene inserted into an XhoI site converted to a PacI site in the EcoRI #9 fragment within the unique long region of HVT. The cIFN gene is expressed from a human cytomegalovirus immediate early promoter. Recombinant HVT expressing cIFN is useful as a vaccine in poultry against Marek's Disease.

Recombinant HVT expressing cIFN is constructed according to the PROCEDURE FOR GENERATING RECOMBINANT HERPESVIRUS FROM OVERLAPPING SUBGENOMIC FRAGMENTS. The following combination of subgenomic clones and enzymes were used: 407-32.2C3 with NotI, 172-07.BA2 with BamHI, 407-32.5G6 with NotI, 672-07.C40 with NotI, 672-01.A40 with NotI, 761-07.A1 with Asc I, 415-09.BA1 with BamHI.

Recombinant HVT expressing avian cytokines is combined with HVT expressing genes for avian disease antigens to enhance immune response. Additional cytokines that are expressed in HVT and have immune stimulating effects include, but not limited to, transforming growth factor beta, epidermal growth factor family, fibroblast growth factors, hepatocyte growth factor, insulin-like growth factors, B-nerve growth factor, platelet-derived growth factor, vascular endothelial growth factor, interleukin 1, IL-1 receptor antagonist, interleukin 2, interleukin 3, interleukin 4, interleukin 5, interleukin 6, IL-6 soluble receptor, interleukin 7, interleukin 8, interleukin 9, interleukin 10, interleukin 11, interleukin 12, interleukin 13, angiogenin, chemokines, colony stimulating factors, granulocyte-macrophage colony stimulating factors, erythropoietin, interferon, interferon gamma, leukemia inhibitory factor, oncostatin M, pleiotrophin, secretory leukocyte protease inhibitor, stem cell factor, tumor necrosis factors, and soluble TNF receptors. These cytokines are

from avian species or other animals including humans, bovine, equine, feline, canine or porcine.

Example 20C Recombinant HVT expressing Marek's disease virus genes and chicken interferon gene.

A recombinant herpesvirus of turkeys contains the chicken interferon (cIFN) gene inserted into an XhoI site converted to a PacI site in the EcoRI #9 fragment within the unique long region of HVT and further contains the MDV gA, gD, and gB genes inserted into a unique StuI site converted into a HindIII site in the HVT US2 gene. The cIFN gene is expressed from an human cytomegalovirus immediate early promoter. The MDV genes are expressed from the endogenous MDV promoters. Recombinant HVT expressing cIFN and MDV gA, gB, and gD is useful as a vaccine with an enhanced immune response in poultry against Marek's Disease.

Recombinant HVT expressing MDV genes and the cIFN gene is constructed according to the PROCEDURE FROM GENERATING RECOMBINANT HERPESVIRUS FROM OVERLAPPING SUBGENOMIC FRAGMENTS. The following combination of subgenomic clones and enzymes are used: 407-32.2C3 with NotI, 172-07.BA2 with BamHI, 407-32.5G6 with NotI, 672-07.C40 with NotI, 672-01.A40 with NotI, 761-07.A1 with Asc I, 721-38.1J uncut.

Example 20D Recombinant HVT expressing Marek's disease virus genes, Newcastle disease virus genes and chicken interferon gene.

A recombinant herpesvirus of turkeys contains the chicken interferon (cIFN) gene inserted into an XhoI site converted to a PacI site in the EcoRI #9 fragment within the unique long region of HVT and further

contains the MDV gA, gD, and gB genes and NDV HN and F genes inserted into a unique StuI site converted into a HindIII site in the HVT US2 gene. The cIFN gene is expressed from an human cytomegalovirus immediate early promoter. The MDV genes are expressed from the endogenous MDV promoters. The NDV HN gene is under the control of the PRV gX promoter, and the NDV F gene is under the control of the HCMV immediate early promoter. Recombinant HVT expressing cIFN and MDV gA, gB, and gD is useful as a vaccine with an enhanced immune response in poultry against Marek's Disease and Newcastle disease.

Recombinant HVT expression MDV genes, NDV genes and cIFN is constructed according to the PROCEDURE FOR GENERATING RECOMBINANT HERPESVIRUS FROM OVERLAPPING SUBGENOMIC FRAGMENTS. The following combination of subgenomic clones and enzymes are used: 407-32.2C3 with NotI, 172-07.BA2 with BamHI, 407-32.5G6 with NotI, 672-07.C40 with NotI, 672-01.A40 with NotI, 761-07.A1 with Asc I, 722-60.E2 uncut.

**Example 20E** Recombinant HVT expressing Marek's disease virus genes and chicken myelomonocytic growth factor gene.

A recombinant herpesvirus of turkeys contains the chicken myelomonocytic growth factor (cMGF) gene inserted into and XhoI site converted to a PacI site in the EcoRI #9 fragment within the unique long region of HVT and further contains the MDV gA, gD, and gB genes inserted into a unique StuI site converted into a HindIII site in the HVT US2 gene. The cMGF gene is expressed from a human cytomegalovirus immediate early promoter. The MDV genes are expressed from the endogenous MDV promoters. Recombinant HVT expression cMGF and MDV gA, gB, and gD is useful as a vaccine with

an enhanced immune response in poultry against Marek's Disease.

Recombinant HVT expressing the cGMF gene and MDV genes is constructed according to the PROCEDURE FOR GENERATING RECOMBINANT HERPESVIRUS FROM OVERLAPPING SUBGENOMIC FRAGMENTS. The following combination of subgenomic clones and enzymes are used: 407-32.2C3 with NotI, 172-07.BA2 with BamHI, 407-32.5G6 with NotI, 672-07.C40 with NotI, 672-01.A40 with NotI, 751-87.A8 with Asc I, 721-38.1J uncut.

Example 20F Recombinant HVT expressing Marek's disease virus genes, Newcastle disease virus genes and chicken myelomonocytic growth factor gene.

A recombinant herpesvirus of turkeys contains the chicken myelomonocytic growth factor (cGMF) gene inserted into an XhoI site converted to a PacI site in the EcoRI #9 fragment within the unique long region of HVT and further contains the MDV gA, gD, and gB genes and NDV HN and F genes inserted into a unique StuI site converted into a HindIII site in the HVT US2 gene. The cGMF gene is expressed from an human cytomegalovirus immediate early promoter. The MDV genes are expressed from the endogenous MDV promoters. The NDV HN gene is under the control of the PRV gX promoter, and the NDV F gene is under the control of the HCMV immediate early promoter. Recombinant HVT expressing cIFN and MDV gA, gB and gD is useful as a vaccine with an enhanced immune response in poultry against Marek's Disease and Newcastle disease.

Recombinant HVT expressing MDV genes, NDV genes and the cGMF gene is constructed according to the PROCEDURE FOR GENERATING RECOMBINANT HERPESVIRUS FROM OVERLAPPING

140

SUBGENOMIC FRAGMENTS. The following combination of subgenomic clones and enzymes are used: 407-32.2C3 with NotI, 172-07.BA2 with BamHI, 407-32.5G6 with NotI, 672-07.C40 with NotI, 672-01.A40 with NotI, 751-87.A8 uncut, 722-60.E2 uncut.

Example 21 Recombinant herpesvirus of turkeys expressing antigens from disease causing microorganisms

10

Recombinant herpesvirus of turkeys (HVT) is useful for expressing antigens from disease causing microorganisms from animals in addition to avian species. Recombinant HVT is useful as a vaccine in animals including but not limited to humans, equine, bovine, porcine, canine and feline.

20

Recombinant HVT is useful as a vaccine against equine diseases when foreign antigens from diseases or disease organisms are expressed in the HVT vector, including but not limited to: equine influenza, equine herpesvirus-1 and equine herpesvirus-4. Recombinant HVT is useful as a vaccine against bovine diseases when foreign antigens from the following diseases or disease organisms are expressed in the HVT vector, including, but not limited to: bovine herpesvirus type 1, bovine viral diarrhea virus, bovine respiratory syncytial virus, bovine parainfluenza virus. Recombinant HVT is useful as a vaccine against swine diseases when foreign antigens from the following diseases or disease organisms are expressed in the HVT vector, including but not limited to: pseudorabies virus, porcine reproductive and respiratory syndrome (PRRS/SIRS), hog cholera virus, swine influenza virus, swine parvovirus, swine rotavirus. Recombinant HVT is useful as a vaccine against feline or canine diseases when foreign antigens from the following diseases or disease organisms are

35

141

expressed in the HVT vector, including but not limited to feline herpesvirus, feline leukemia virus, feline immunodeficiency virus and *Dirofilaria immitis* (heartworm). Disease causing microorganisms in dogs include, but are not limited to canine herpesvirus, canine distemper, canine adenovirus type 1 (hepatitis), adenovirus type 2 (respiratory disease), parainfluenza, *Leptospira canicola*, icterohemorrhagia, parvovirus, coronavirus, *Borrelia burgdorferi*, canine herpesvirus, *Bordetella bronchiseptica*, *Dirofilaria immitis* (heartworm) and rabies virus.

Example 22 Human vaccines using recombinant herpesvirus of turkeys as a vector

Recombinant herpesvirus of turkeys (HVT) is useful as a vaccine against human diseases. For example, human influenza is a rapidly evolving virus whose neutralizing viral epitopes are rapidly changing. A useful recombinant HVT vaccine is one in which the influenza neutralizing epitopes are quickly changed to protect against new strains of influenza. Human influenza HA and NA genes are cloned using polymerase chain reaction into the recombinant HVT. Recombinant HVT is useful as a vaccine against other human diseases when foreign antigens from the following diseases or disease organisms are expressed in the HVT vector: hepatitis B virus surface and core antigens, hepatitis C virus, human immunodeficiency virus, herpes simplex virus-1, herpes simplex virus-2, human cytomegalovirus, Epstein-Barr virus, Varicella-Zoster virus, human herpesvirus-6, human herpesvirus-7, human influenza, measles virus, hantaan virus, pneumonia virus, rhinovirus, poliovirus, human respiratory syncytial virus, retrovirus, human T-cell leukemia virus, rabies virus, mumps virus, malaria (*Plasmodium falciparum*), *Bordetella pertussis*, Diphtheria, *Rickettsia prowazekii*,

*Borrelia bergdorferi*, Tetanus toxoid, malignant tumor antigens,

Recombinant HVT expressing human cytokines is combined  
5 with HVT expressing genes for human disease antigens to  
enhance immune response. Additional cytokines,  
including, but not limited to, transforming growth  
factor beta, epidermal growth factor family, fibroblast  
10 growth factors, hepatocyte growth factor, insulin-like  
growth factors, B-nerve growth factor, platelet-derived  
growth factor, vascular endothelial growth factor,  
interleukin 1, IL-1 receptor antagonist, interleukin 2,  
interleukin 3, interleukin 4, interleukin 5,  
interleukin 6, IL-6 soluble receptor, interleukin 7,  
15 interleukin 8, interleukin 9, interleukin 10,  
interleukin 11, interleukin 12, interleukin 13,  
angiogenin, chemokines, colony stimulating factors,  
granulocyte-macrophage colony stimulating factors,  
erythropoietin, interferon, interferon gamma, leukemia  
20 inhibitory factor, oncostatin M, pleiotrophin,  
secretory leukocyte protease inhibitor, stem cell  
factor, tumor necrosis factors, and soluble TNF  
receptors from human and other animals are expressed in  
HVT and have immune stimulating effects.

25

Example 23 Improved production of a recombinant  
herpesvirus of turkeys vaccine.

Cytokines, such as interferons and interleukins,  
30 inhibit the replication of viruses in cell culture and  
in the animal. Inhibition of the production of  
cellular interferon or interleukin improves the growth  
of recombinant HVT in cell culture. Chicken interferon  
(cIFN) expressed from a recombinant swinepox vector was  
35 added to chick embryo fibroblast (CEF) cell cultures  
and infected with S-HVT-012 which expresses  $\beta$ -  
galactosidase. cIFN added to the cell culture media

143

reduced both the expression of  $\beta$ -galactosidase and S-HVT-012 titer in a dose dependent manner. This result indicates that growth of HVT is limited by exogenous addition of chicken interferon. Several strategies are utilized to improve growth of HVT in CEF cells by removing or inactivating chicken interferon activity in the CEF cells.

In one embodiment, a chicken interferon neutralizing antibody is added to the culture medium to inhibit the chicken interferon activity and improve the growth of recombinant HVT in CEF cell culture. The anti-cIFN antibody is derived from mouse or rabbit sera of animals injected with chicken interferon protein, preferably the cIFN is from a recombinant swinepox virus expressing chicken interferon.

Poxviruses secrete cytokine-inhibiting proteins as an immune evasion strategy. One type of poxvirus immune evasion mechanism involves poxvirus soluble receptors for interleukins, interferon, or tumor necrosis factors which inactivate the cytokines and allow viral replication (60). In an embodiment of the invention, fowlpox virus is useful as a source of chicken interferon-inhibiting proteins and other immune evasion proteins. Conditioned media from FPV infected CEF cell cultures is added to the HVT infected CEF cells to inhibit interferon activity and increase the HVT titer. In a further embodiment, the recombinant chicken interferon inhibiting protein or another poxvirus immune evasion protein is expressed in a vector in combination with an HVT vaccine composition to increase the HVT titer.

Chicken embryo fibroblast cells have been engineered to express foreign genes (61). In a further embodiment, an interferon-negative CEF cell line is constructed by

the introduction of a vector expressing a gene encoding antisense RNA for chicken interferon into the CEF cell line. Recombinant HVT grown in an interferon-negative CEF cell line demonstrate improved virus titers compared to HVT grown in an interferon producing CEF cell line. In a further embodiment, a chicken myelomonocytic growth factor (cMGF) -positive CEF cell line is constructed by the introduction of a vector expressing the cMGF gene into the CEF cells. Recombinant HVT grown in a cMGF-positive CEF cell line demonstrates improved virus titers compared to HVT grown in a cMGF negative CEF cell line.

Recombinant HVT of the present invention is useful as a vaccine against Marek's disease and against other diseases as outlined in previous examples. An increased efficiency in growth of recombinant HVT in CEF cells is useful in production of the vaccine.

## SEQUENCE LISTING

(1) GENERAL INFORMATION:

- (i) APPLICANT: SYNTRO CORPORATION
- (ii) TITLE OF INVENTION: Recombinant Herpesvirus of Turkeys And Uses  
Thereof
- (iii) NUMBER OF SEQUENCES: 60
- (iv) CORRESPONDENCE ADDRESS:
- (A) ADDRESSEE: John P. White
- (B) STREET: 1185 Avenue of the Americas
- (C) CITY: New York
- (D) STATE: New York
- (E) COUNTRY: USA
- (F) ZIP: 10036
- (v) COMPUTER READABLE FORM:
- (A) MEDIUM TYPE: Floppy disk
- (B) COMPUTER: IBM PC compatible
- (C) OPERATING SYSTEM: PC-DOS/MS-DOS
- (D) SOFTWARE: PatentIn Release #1.0, Version #1.25
- (vi) CURRENT APPLICATION DATA:
- (A) APPLICATION NUMBER:
- (B) FILING DATE: 09-AUG-1995
- (C) CLASSIFICATION:
- (viii) ATTORNEY/AGENT INFORMATION:
- (A) NAME: White, John P
- (B) REGISTRATION NUMBER: 28,678
- (ix) TELECOMMUNICATION INFORMATION:
- (A) TELEPHONE: (212)278-0400
- (B) TELEFAX: (212)391-0526
- (C) TELEX: 422523

(2) INFORMATION FOR SEQ ID NO:1:

- ```
(i) SEQUENCE CHARACTERISTICS:
      (A) LENGTH: 3350 base pairs
      (B) TYPE: nucleic acid
      (C) STRANDEDNESS: double
      (D) TOPOLOGY: linear

(ii) MOLECULE TYPE: DNA (genomic)

(iii) HYPOTHETICAL: NO

(iv) ANTI-SENSE: NO

(ix) FEATURE:
      (A) NAME/KEY: CDS
      (B) LOCATION: 129..2522

(xi) SEQUENCE DESCRIPTION: SEQ ID NO:1:

## (2) INFORMATION FOR SEQ ID NO:4:

## (i) SEQUENCE CHARACTERISTICS:

- (A) LENGTH: 369 amino acids
- (B) TYPE: amino acid
- (D) TOPOLOGY: linear

## (ii) MOLECULE TYPE: protein

## (xi) SEQUENCE DESCRIPTION: SEQ ID NO:4:

## (2) INFORMATION FOR SEQ ID NO:14:

- (i) SEQUENCE CHARACTERISTICS:
- (A) LENGTH: 3489 base pairs
  - (B) TYPE: nucleic acid
  - (C) STRANDEDNESS: double
  - (D) TOPOLOGY: linear

(ii) MOLECULE TYPE: DNA (genomic)

(iii) HYPOTHETICAL: NO

181

(iv) ANTI-SENSE: NO

(ix) FEATURE:

(A) NAME/KEY: CDS

(B) LOCATION: 1..3489

(xi) SEQUENCE DESCRIPTION: SEQ ID NO:14:

33

What is claimed is:

1. A recombinant herpesvirus of turkeys comprising a foreign DNA sequence encoding a cytokine inserted into an insertion region which comprises a XhoI site within a EcoRI #9 fragment of a herpesvirus of turkeys viral genome, and the foreign DNA sequence encoding a cytokine which is capable of being expressed in a host cell infected with the herpesvirus of turkeys.
2. The recombinant herpesvirus of turkeys of claim 1, wherein the cytokine is chicken myelomonocytic growth factor (cMGF), chicken interferon (cIFN), interleukin-2, interleukin-6, interleukin-12, interferons, granulocyte-macrophage colony stimulating factors, or interleukin receptors.
3. The recombinant herpesvirus of turkeys of claim 1, further comprising a second foreign DNA sequence.
4. The recombinant herpesvirus of turkeys of claim 3, wherein the foreign DNA sequence encodes a polypeptide.
5. The recombinant herpesvirus of turkeys of claim 4, wherein the polypeptide is antigenic.
6. The recombinant herpesvirus of turkeys of claim 4, wherein the polypeptide is *E. coli* beta-galactosidase.
7. The recombinant herpesvirus of turkeys of claim 2, which is designated S-HVT-144.

8. The recombinant herpesvirus of turkeys of claim 5, wherein the foreign DNA sequence encoding an antigenic polypeptide is inserted into an insertion region of the herpesvirus of turkeys viral genome comprising a unique *StuI* site within the US2 gene.
9. The recombinant herpesvirus of turkeys of claim 8, wherein the foreign DNA sequence encodes an antigenic polypeptide selected from the group consisting of: Marek's disease virus, Newcastle disease virus, Infectious laryngotracheitis virus, Infectious bronchitis virus, and Infectious bursal disease virus.
10. The recombinant herpesvirus of turkeys of claim 9, wherein the foreign DNA sequence encodes Marek's disease virus glycoprotein A, Marek's disease virus glycoprotein B or Marek's disease virus glycoprotein D.
11. The recombinant herpesvirus of turkeys of claim 9, wherein the foreign DNA sequence encodes Newcastle disease virus fusion protein or Newcastle disease virus hemagglutinin-neuraminidase.
12. The recombinant herpesvirus of turkeys of claim 9, wherein the foreign DNA sequence encodes Infectious laryngotracheitis virus glycoprotein B, Infectious laryngotracheitis virus glycoprotein I or Infectious laryngotracheitis virus glycoprotein D.
13. The recombinant herpesvirus of turkeys of claim 9, wherein the foreign DNA sequence encodes

Infectious bronchitis virus spike protein or Infectious bronchitis virus matrix protein.

14. The recombinant herpesvirus of turkeys of claim 9, wherein the foreign DNA sequence encodes Infectious bursal disease virus VP2, Infectious bursal disease virus VP3, or Infectious bursal disease virus VP4.
15. The recombinant herpesvirus of turkeys of claim 1, wherein the cytokine is under control of an endogenous upstream herpesvirus promoter.
16. The recombinant herpesvirus of turkeys of claim 15, wherein the cytokine is under control of a heterologous upstream promoter.
17. The recombinant herpesvirus of turkeys of claim 15, wherein the promoter is selected from PRV gX, HSV-1 alpha 4, HCMV immediate early, MDV gA, MDV gB, MDV gD, ILT gB, BHV-1.1 VP8 and ILT gD.
18. A homology vector for producing a recombinant herpesvirus of turkeys by inserting a foreign DNA sequence encoding a cytokine into the viral genome of a herpesvirus of turkey which comprises a double-stranded DNA molecule consisting essentially of:
- a) double stranded foreign DNA not usually present within the herpesvirus of turkeys viral genome;

- 5                   b)       at one end the foreign DNA, double-stranded herpesvirus of turkeys DNA homologous to the viral genome located at one side of the EcoR1 #9 fragment of the coding region of the herpesvirus of turkeys viral genome; and
- 10                   c)       at the other end of the foreign DNA, double-stranded herpesvirus of turkeys DNA homologous to the viral genome located at the other side of the EcoR1 #9 of the coding region of the herpesvirus of turkeys viral genome.
- 15       19.       The recombinant herpesvirus of turkeys of claim 18, wherein the cytokine is chicken myelomonocytic growth factor (cMGF), chicken interferon (cIFN), interleukin-2, interleukin-6, interleukin-12, interferons, granulocyte-macrophage colony stimulating factors, or interleukin receptors.
- 20
- 25       20.       A homology vector of claim 18, further comprising a second foreign DNA sequence encoding an antigenic polypeptide
- 30       21.       A homology vector of claim 20, wherein the antigenic polypeptide is selected from a group consisting essentially of: Marek's disease virus, Newcastle disease virus, Infectious laryngotracheitis virus, Infectious bronchitis virus and Infectious bursal disease virus.
- 35       22.       A homology vector of claim 20, wherein the antigenic polypeptide is selected from a group consisting essentially of: Marek's disease virus

217

- glycoprotein A, Marek's disease virus  
glycoprotein B, Marek's disease virus  
glycoprotein D, Newcastle disease virus fusion  
protein, Newcastle disease virus hemagglutinin-  
neuraminidase, Infectious laryngotracheitis virus  
glycoprotein B, Infectious laryngotracheitis  
virus glycoprotein I, Infectious  
laryngotracheitis virus glycoprotein D,  
Infectious bronchitis virus spike protein,  
Infectious bronchitis virus matrix protein,  
Infectious bursal disease virus VP2, Infectious  
bursal disease virus VP3, and Infectious bursal  
disease virus VP4.
23. The homology vector of claim 20, wherein the  
foreign DNA sequence encodes a screenable marker.
24. The homology vector of claim 23, wherein the  
screenable marker is *E. coli* B-galactosidase or  
*E. coli* B-glucuronidase.
25. The homology vector of claim 18 designated 751-  
87.A8.
26. The homology vector of claim 18 designated 761-  
07.A1.
27. A vaccine useful for immunizing a bird against  
Marek's disease virus which comprises an  
effective immunizing amount of the recombinant  
herpesvirus of turkeys of claims 10 and a  
suitable carrier.
28. A vaccine useful for immunizing a bird against  
Newcastle disease virus virus which comprises an  
effective immunizing amount of the recombinant

herpesvirus of turkeys of claim 11 and a suitable carrier.

- 5           29.   A vaccine useful for immunizing a bird against Infectious laryngotracheitis virus which comprises an effective immunizing amount of the recombinant herpesvirus of turkeys of claim 12 and a suitable carrier.
- 10          30.   A multivalent vaccine useful for immunizing a bird against Marek's disease virus and Newcastle disease virus which comprises an effective immunizing amount of the recombinant herpesvirus of turkeys of claims 11.
- 15          31.   A method of immunizing a bird against Marek's disease virus which comprises administering to the bird an effecting immunizing dose of the vaccine of claim 27.
- 20          32.   A host cell infected with the recombinant herpesvirus of turkey of claim 1.
- 25          33.   A host cell of claim 32, wherein the host cell is an avian cell.
- 30          34.   A recombinant herpesvirus of turkeys-Marek's disease virus chimera comprising a herpesvirus of turkeys unique long viral genome region and a Marek's disease virus unique short region.
- 35          35.   The recombinant herpesvirus of turkeys-Marek's disease virus chimera of claim 34, wherein a foreign DNA sequence is inserted within the EcoR1 #9 fragment of the herpesvirus of turkeys viral genome, and is capable of being expressed in a

host cell infected with the herpesvirus of turkeys.

5        36.    The recombinant herpesvirus of turkeys-Marek's disease virus chimera of claim 35, wherein the foreign DNA sequence encodes a polypeptide.

10       37.    The recombinant herpesvirus of turkeys-Marek's disease virus chimera of claim 36, wherein the foreign DNA sequence encodes a cytokine.

15       38.    The recombinant herpesvirus of turkeys-Marek's disease virus chimera of claim 37, wherein the cytokine is a chicken myelomonocytic growth factor (cMGF) or chicken interferon (cIFN).

20       39.    The recombinant herpesvirus of turkeys-Marek's disease virus chimera of claim 38, further comprising a foreign DNA sequence encoding the antigenic polypeptide selected from the group consisting of: Marek's disease virus, Newcastle disease virus, Infectious laryngotracheitis virus, Infectious bronchitis virus and Infectious bursal disease virus.

25       40.    The recombinant herpesvirus of turkeys of claim 39, designated S-HVT-145.

# INTERNATIONAL SEARCH REPORT

Inter. onal application No.  
PCT/US95/10245

## A. CLASSIFICATION OF SUBJECT MATTER

IPC(6) : Please See Extra Sheet.

US CL : Please See Extra Sheet.

According to International Patent Classification (IPC) or to both national classification and IPC

## B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

U.S. : Please See Extra Sheet.

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)

APS, Medline, CABA, Agricola, Derwent WPIDS, Inpadoc search terms: herpesvirus, turkeys, avian, recombinant, vaccine

## C. DOCUMENTS CONSIDERED TO BE RELEVANT

| Category* | Citation of document, with indication, where appropriate, of the relevant passages                                                                                                        | Relevant to claim No. |
